Computer Chess Compendium D. Levy, 2014-01-15 Computer Chess Compendium David N. L. Levy, 1988 For many years I have been interested in computer chess and have collected almost every learned paper and article on the subject that I could find My files are now quite large and a considerable amount of time effort and expense has been required to build up this collection I have often thought how difficult it must be for many computer chess enthusiasts to acquire copies of articles that they see referenced in some other work Unless one has access to a good reference library the task is almost impossible I therefore decided to try to make available in one volume as many as possible of the most interesting and important articles and papers ever written on the subject Such a selection is naturally somewhat subjective and I hope that I will not offend authors whose works have been excluded In particular I have decided to exclude any material which has appeared in the Journal of the International Computer Chess Association ICCA or in its precursor the ICCA Newsletter The reason is simply that the ICCA itself is in the process of compiling a compendium containing the most important material published in those sources For further information on ICCA membership and publications the reader is invited to contact Professor H 1 van den Herik or Dr Jonathan Schaeffer University of Limburg Computing Science Dcpaitment Department of Computer Science University of Alberta 6200 MD Maastricht Edmonton Netherlands Alberta Canada T6G 2HI

Scalable Search in Computer Chess Ernst A. Heinz, 2000 This book presents the results of our past two and a half years of research aimed at increasing the scalability and performance of game tree search in computer chess We elaborate on our respective works in the areas of I selective forward pruning II the efficient application of game theoretical knowledge and III the behaviour of the search at increasing depths The broad range of topics covered by the three distinct parts of the book seek to provide interesting material for everybody interested in the field of Computational Intelligence regardless of their individual focus researcher student or other The text does not require readers to know about chess and computer game playing beforehand The initial chapter entitled Computer Chess Primer introduces all the necessary basics and fundamentals thereof The remaining chapters however go far beyond those topics They show how to make sophisticated game tree searchers still more scalable at ever higher depths Throughout the whole book our high speed and master strength chess program DARKTHOUGHT serves as a realistic test vehicle to

conduct numerous experiments at unprecedented search depths The extensive experimental evaluations provide convincing empirical evidence for the practical usefulness of the techniques presented by us These results will certainly be of special interest to researchers and programmers of computer strategy games alike chess checkers Go and Othello in particular Last but not least I like to mention that I am most grateful to the series editors for offering me the opportunity to publish my book under their auspices

Is Law Computable? Simon Deakin, Christopher Markou, 2020-11-26 What does computable law mean for the autonomy authority and legitimacy of the legal system Are we witnessing a shift from Rule of Law to a new Rule of Technology Should we even build these things in the first place This unique volume collects original papers by a group of leading international scholars to address some of the fascinating questions raised by the encroachment of Artificial Intelligence AI into more aspects of legal

process administration and culture Weighing near term benefits against the longer term and potentially path dependent implications of replacing human legal authority with computational systems this volume pushes back against the more uncritical accounts of AI in law and the eagerness of scholars governments and LegalTech developers to overlook the more fundamental and perhaps bigger picture ramifications of computable law With contributions by Simon Deakin Christopher Markou Mireille Hildebrandt Roger Brownsword Sylvie Delacroix Lyria Bennet Moses Ryan Abbott Jennifer Cobbe Lily Hands John Morison Alex Sarch and Dilan Thampapillai as well as a foreword from Frank Pasquale Advances in Computer Games ,1999 **Eighth Annual Computer Game Developers Conference Proceedings** ,1994 AI Magazine ,1990

Heuristic Programming in Artificial Intelligence 3 Victor Allis,1992 Computer Games I David N.L. Levy,2012-12-06 Computer Games I is the first volume in a two part compendium of papers covering the most important material available on the development of computer strategy games These selections range from discussions of mathematical analyses of games to more qualitative concerns of whether a computer game should follow human thought processes rather than a brute force approach to papers which will benefit readers trying to program their own games Contributions include selections from the major players in the development of computer games Claude Shannon whose work still forms the foundation of most contemporary chess programs Edward O Thorpe whose invention of the card counting method caused Las Vegas casinos to change their blackjack rules and Hans Berliner whose work has been fundamental to the development of backgammon and chess games
