Data Analysis Siegmund Brandt, 2012-12-06

1.1 Typical Problems of Data Analysis Every branch of experimental science after passing through an early stage of qualitative description concerns itself with quantitative studies of the phenomena of interest i.e. measurements In addition to designing and carrying out the experiment an important task is the accurate evaluation and complete exploitation of the data obtained Let us list a few typical problems

1. A study is made of the weight of laboratory animals under the influence of various drugs After the application of drug A to 25 animals an average increase of 5 % is observed Drug B used on 10 animals yields a 3 % increase Is drug A more effective The averages 5 % and 3 % give practically no answer to this question since the lower value may have been caused by a single animal that lost weight for some unrelated reason One must therefore study the distribution of individual weights and their spread around the average value Moreover one has to decide whether the number of test animals used will enable one to differentiate with a certain accuracy between the effects of the two drugs

2. In experiments on crystal growth it is essential to maintain exactly the ratios of the different components From a total of 500 crystals a sample of 20 is selected and analyzed
