

NUMBERS is one of the most important topics required for competitive entrance exams. In this chapter, we have put together a number of models of problems – mainly based on various problems that have been appearing in different exams.

BASIC ARITHMETIC OPERATIONS

Addition is the most basic operation. We have an intuitive understanding of the operation. It is the process of finding out the single number or fraction equal to two or more quantities taken together. The two (or more) numbers that are added are called addends and the result of the addition is called the sum. For two numbers A and B, this is denoted as $A + B$.

Subtraction is the process of finding out the quantity left when a smaller quantity (number or fraction) is reduced from a larger one. This is called the difference of the two numbers. The word difference is taken to mean a positive quantity, i.e., the difference of 10 and 8 is 2. The difference of 8 and 10 is also 2. This is also referred to as the remainder.

Multiplication is repeated addition. The number that is added repeatedly is the multiplicand. The number of times it is added is the multiplier. The sum obtained is the product.

For example, in the multiplication $3 \times 4 = 12$, 3 is the multiplicand, 4 is the multiplier and 12 is the product.

Division is repeated subtraction. From a given number, we subtract another repeatedly until the remainder is less than the number that we are subtracting. The number from which we are subtracting the second one is the dividend. The number that is subtracted repeatedly (the second one) is the divisor. The number of times it is subtracted is the quotient. The number that remains after we are done subtracting is the remainder. Division can also be thought of as the inverse of multiplication. A/B is that number with which B has to be multiplied to get A. For example, in the division $32/5$, 32 is the dividend, 5 is the divisor, 6 is the quotient and 2 is the remainder.

Involution (or raising to the power n) is repeated multiplication. Thus, a^n is the product of n a's. Here, a is the base, n is the index and a^n is the n^{th} power of a. For example, $a \times a = a^2$, which is the second power of a and $a \times a \times a = a^3$, which is the third power of a.

Evolution is the inverse of involution. The n^{th} root of a number is that number whose n^{th} power is the given number. The root of any number or expression is that quantity which when multiplied by itself the requisite number of times produces the given expression.

For example, the square root of a, \sqrt{a} when multiplied by itself two times, gives a; similarly, the cube root of a, $\sqrt[3]{a}$ when multiplied by itself three times, gives a.

All the above operations are performed in Algebra also. Algebra treats quantities just as Arithmetic does, but with greater generality, for algebraic quantities are denoted

by symbols which may take any value we choose to assign them as compared to definite values usually used in arithmetic operations.

Rule of Signs

The product of two terms with like signs is positive; the product of two terms with unlike signs is negative.

Example: $-1 \times -1 = +1$;
 $+1 \times -1 = -1$;
 $+1 \times +1 = +1$;
 $-1 \times +1 = -1$;

HIERARCHY OF ARITHMETIC OPERATIONS

To simplify arithmetic expressions which involve various operations like brackets, multiplications, additions, etc. a particular sequence of the operations has to be followed. For example, $2 + 3 \times 4$ has to be calculated by multiplying 3 with 4 and the result 12 added to 2 to give the final result of 14 (you should not add 2 to 3 first to take the result 5 and multiply this 5 by 4 to give the final result as 20). This is because in arithmetic operations, multiplication should be done first before addition is taken up.

The hierarchy of arithmetic operations are given by a rule called BODMAS rule. The operations have to be carried out in the order in which they appear in the word BODMAS, where different letters stand for the following operations:

- B** Brackets
- O** Of
- D** Division
- M** Multiplication
- A** Addition
- S** Subtraction

There are four types of brackets:

- (i) Vinculum : This is represented by a bar on the top of the numbers. For example, in $2 + 3 \overline{-4 + 3}$; the figures under the vinculum have to be calculated as $4 + 3$ first and the "minus" sign before 4 is applicable to 7. Thus the given expression is equal to $2 + 3 - 7$, which is equal to -2 .
- (ii) Simple Brackets: These are represented by ()
- (iii) Curly Brackets: These are represented by { }
- (iv) Square Brackets: These are represented by []

The brackets in an expression have to be opened in the order of vinculum, simple brackets, curly brackets and square brackets, i.e., [{ () }] to be opened from inside outwards.

After brackets is O in the BODMAS rule standing for "of" which means multiplication. For example, $1/2$ of 4 will be equal to $1/2 \times 4$ which is equal to 2.

After O, the next operation is D standing for division. This is followed by M standing for multiplication. After Multiplication, A standing for addition will be performed. Then, S standing for subtraction is performed.
