Chill Zone:

Fundamentals of Materials Science Zhengming Sun, Peigen Zhang, Wei Liu, Wei He, 2025-07-19 This book introduces the fundamentals of materials science and is intended to be used by undergraduate students in materials related majors mainly in China. The book focuses on the basic theories of the three primary types of solid state materials: metals, ceramics, and polymers and composites, and emphasizes the relationships between the structures and properties of materials. In addition, it presents the crystal structure, imperfections, microstructure, material processing, and performance of the materials from the electronic and atomic levels. The physicochemical processes in materials, such as diffusion, phase diagram, and phase transition, are also explained from the thermodynamic point of view. To highlight the fundamental role of materials science to modern technologies and the development of society, materials science related content about Nobel Prizes is introduced in this book. Exercises and questions are included at the end of each chapter for students to practice and gain hands-on experience. Given its scope, this book is of interest to undergraduate students majoring in materials science and engineering and other related areas, and is also beneficial for researchers, graduates, and engineers with interdisciplinary backgrounds.

Magnetic Fabric Geological Society of London, 2004 The relationship between magnetic fabric and petrofabric is complex and depends on various factors, including the composition, concentration, and grain size of mineral grains. Ongoing research in geological applications is paralleled by studies of the fundamental mineral magnetic phenomena involved. The papers in this book represent the current state of investigations in magnetic anisotropy studies as a discipline that integrates geological interpretations, mineral fabric development, technical advances, and rock magnetic properties.
