Complex Mediums Iii:

Electrodynamics of Metamaterials Andrey K. Sarychev, Vladimir M. Shalaev, 2007 Local electromagnetic field fluctuations and related enhancement of nonlinear phenomena in metal dielectric composites near the percolation threshold percolation composites have recently become an area of active study because of the many fundamental problems involved and the high potential for various applications It has been recognized recently that local field fluctuations can be especially large in the optical and infrared spectral ranges due to the surface plasmon resonance in metallic granules and their clusters The strong fluctuations of the local electric and magnetic fields result in the enhancement of various optical effects anomalous absorption Rayleigh and Raman scattering generation of the higher harmonic Kerr nonlinearity etc Nonlinear percolation composites are potentially of great practical importance as media with intensity dependent dielectric functions and in particular as nonlinear filters and optical bistable elements The optical response of nonlinear composites can be tuned for example by controlling the volume fraction and morphology of constituents This book presents a new theory of electromagnetic field distribution and nonlinear optical processes in metal dielectric composites The new approach is based on a percolation theory and the fact that the problem of optical excitations in percolation composites mathematically maps the Anderson transition problem in quantum mechanics The theory predicts localization of the excitations surface plasmons in percolation composites and describes in detail the localization pattern that allows one to obtain relatively simple expressions for the enhancement of linear and nonlinear optical responses This theory is supported by recent near field experiments where the surface plasmon localization has been directly observed in the percolating composites in optical and microwave bands

Sculptured Thin Films Akhlesh Lakhtakia, R. Messier, 2005 Sculptured thin films STF are a class of nanoengineered materials with properties that can be designed and realized in a controllable manner using physical vapor deposition This text presented as a short course at the SPIE Optical Science and Technology Symposium couples detailed knowledge of thin film morphology with the optical response characteristics of STF devices An accompanying CD contains Mathematica TM programs for use with the presented formalisms Thus readers will learn to design and engineer STF materials and devices for future applications particularly with optical applications Graduate students in optics and practicing optical engineers will find the text valuable as well as those interested in emerging nanotechnologies for optical devices

Mollicutes: From Evolution To Pathogenesis, Volume II Glenn Francis Browning, Chih-Horng Kuo, Florence Tardy, Meghan May , Christine Citti, 2024-11-12 The class Mollicutes trivial name mycoplasma encompasses a large group of bacteria having no cell wall and a minute size genome 580 to 2 200 kb From an evolutionary point of view Mollicutes are derived from a common ancestor to Gram positive bacteria with low G C content and are considered as some of the most evolved prokaryotes Despite their limited coding capacity most Mollicutes can be cultivated in axenic media and thus include some of

the simplest life forms capable of autonomous replication As such these minimal bacteria have been used as a biological model to decipher cell functions and as blueprints for the synthesis of synthetic minimal genomes Far from models this monophyletic group is well known to include a broad range of important human animal plant and insect pathogens In their hosts these minimal pathogens usually establish persistent infections along with degenerative diseases which have a significant impact on human and animal health as well as on livestock and crop production

elements This book gathers review articles analyzing current views on the mechanism and bio chemistry of biosorption the performance of bacterial fungal and algal biomass and the practical aspects of biosorbent preparation and engineering It also reviews the physico chemical evaluations of biosorbents and modelling of the process as well as the importance of biosorption during heavy metal removal using living cells It is a reference work for scientists environmental safety engineers and R D specialists who wish to further promote biosorption research and use the accumulated knowledge to develop and build industrial applications of biosorption in heavy metal separation technologies
