Component Deployment:

Component Deployment Alan Dearle, Susan Eisenbach, 2005-11-03 This volume of Lecture Notes in Computer Science contains the proceedings of the 3rd Working Conference on Component Deployment CD 2005 which took place from 28 to 29 November 2005 in Grenoble France and co-located with Middleware 2005 CD 2005 is the third international conference in the series the first two being held in Berlin and Edinburgh in 2002 and 2004 respectively The proceedings of both these conferences were also published by Springer in the Lecture Notes in Computer Science series and may be found in volumes 2370 and 3083 Component deployment addresses the tasks that need to be performed after components have been developed and addresses questions such as What do we do with components after they have been built How do we deploy them into their execution environment How can we evolve them once they have been deployed CD 2005 brought together researchers and practitioners with the goal of developing a better understanding of how deployment takes place in the wider context The Program Committee selected 15 papers 12 long papers three short papers out of 29 submissions All submissions were reviewed by at least three members of the Program Committee Papers were selected based on originality quality soundness and relevance to the workshop

Component Deployment Judith Bishop, 2003-08-02 Deployment is the act of taking components and readying them for productive use There may be steps following deployment such as installation or management related functions but all decisions about how to configure and compose assemble a component are made at the deployment stage This is therefore the one opportunity in the software lifecycle to bridge the gap between what the component developer couldn't know about the deployment environment and what the environment's developer couldn't know about the open set of deployable components It is not surprising that deployment as a dedicated step gains importance when addressing issues of system wide qualities such as coping with constrained resources or preparing for component adaptation and system evolution Yet component deployment is still a discipline in its infancy it became mainstream practice only in the mid 1990s Much of the best practice impulse originated in products like Microsoft's Transaction Server and its approach to attribute based programming and later products like Enterprise JavaBeans and now the Corba Component Model All these address the specific needs of enterprise application servers However the potential of the deployment concept goes far beyond this Deployment can and should touch effectively all truly component based solutions The proceedings of Component Deployment 2002 represent a good cross-section of the gamut of deployment issues From customization to address source constraints to reconfiguration of deployed systems and from architecture to design to languages the avid reader will find some contribution

Component Deployment Judith Bishop, 2002-06-14 Deployment is the act of taking components and readying them for productive use There may be steps following deployment such as installation or management related functions but all decisions about how to configure and compose assemble a component are made at the deployment stage This is therefore the one opportunity in the software lifecycle to bridge the gap between what the component developer couldn't

know about the deployment environment and what the environment's developer couldn't know about the open set of deployable components. It is not surprising that deployment as a dedicated step gains importance when addressing issues of system-wide qualities such as coping with constrained resources or preparing for component adaptation and system evolution. Yet component deployment is still a discipline in its infancy; it became mainstream practice only in the mid 1990s. Much of the best practice impulse originated in products like Microsoft's Transaction Server and its approach to attribute-based programming and later products like Enterprise JavaBeans and now the Corba Component Model. All these address the specific needs of enterprise application servers. However, the potential of the deployment concept goes far beyond this. Deployment can and should touch effectively all truly component-based solutions. The proceedings of Component Deployment 2002 represent a good cross-section of the gamut of deployment issues. From customization to address source constraints to reconfiguration of deployed systems and from architecture to design to languages, the avid reader will find some contribution.

Component Deployment, 2005 **Component Deployment** Wolfgang Emmerich, Alexander L. Wolf, 2004-05-03 This volume of the Lecture Notes in Computer Science series contains the proceedings of the second Working Conference on Component Deployment which took place May 20-21 2004 at the e Science Institute in Edinburgh, Scotland, as a collocated event of the International Conference on Software Engineering. Component deployment addresses what needs to be done after a component has been developed. Component deployment includes activities such as component customization, configuration, integration, activation, deactivation, and commissioning. The emerging research community that investigates component deployment concerns itself with the principles, methods, and tools for deployment activities. The community held its first working conference in Berlin, Germany, in June 2002. The proceedings were republished by Springer Verlag as volume 2370 of the Lecture Notes in Computer Science series. The program of this year's conference consisted of an invited talk and 16 technical paper presentations. The invited talk was given by Patrick Goldsack of Hewlett-Packard Research Laboratories, Bristol, UK. He presented the Smart Frog component deployment framework that HP released as Open Source. The technical papers were carefully selected from a total of 34 submitted papers. Each paper was thoroughly peer reviewed by at least three members of the program committee, and consensus on acceptance was achieved by means of an electronic PC meeting.

Component-Based Development with Visual C# Ted Faison, 2002-04-15 This tutorial guide provides information on how to design, debug, and deploy applications using component-based development and the new development tool from Visual Studio .NET. Visual C# provides power and speed in an object-oriented environment so developers can create and deploy flexible applications quickly. The author also explains how to develop a wide variety of components such as web controls, data access, enterprise-level components, file service, multithreaded components, accessibility components, and more.
