Welcome to the Second International Conference on Mobile Data Management MDM2001 The conference serves as a forum for the exchange of technical ideas and research results in the areas of mobility and database management This year we have a very exciting program for MDM2001 Many quality papers were submitted to the conference All of the submitted papers were viewed by at least three PC members Due to the limitations of the program schedule as well as the desire to organize the conference using a single track format we selected only 18 papers for full presentation at the conference As a result many excellent papers could not be accepted The papers chosen for presentation span a large range of topics from network protocol issues up to the semantics of mobile applications The common theme of all these papers is their recognition of the central role played by data management techniques in the development of the emerging world of mobile and wireless applications We have loosely organized these papers into six areas 1 DATA MANAGEMENT ARCHITECTURES 2 CONTENT DELIVERY 3 DATA BROADCASTING 4 CACHING AND HOARDING 5 COPING WITH MOVEMENT 6 NETWORKS AND SYSTEMS ISSUES In addition to the research track we have sought to broaden the scope of the conference with an industrial session as well as poster presentations Overall the program strikes a comfortable balance between applied and theoretically oriented papers

Replicated Data Management for Mobile Computing Terry Douglas,2008-06-08 Managing data in a mobile computing environment invariably involves caching or replication In many cases a mobile device has access only to data that is stored locally and much of that data arrives via replication from other devices PCs and services Given portable devices with limited resources weak or intermittent connectivity and security vulnerabilities data replication serves to increase availability reduce communication costs foster sharing and enhance survivability of critical information Mobile systems have employed a variety of distributed architectures from client server caching to peer to peer replication Such systems generally provide weak consistency models in which read and update operations can be performed at any replica without coordination with other devices The design of a replication protocol then centers on issues of how to record propagate order and filter updates Some protocols utilize operation logs whereas others replicate state Systems might provide best effort delivery using gossip protocols or multicast or guarantee eventual consistency for arbitrary communication patterns using recently developed pairwise knowledge driven protocols Additionally systems must detect and resolve the conflicts that arise from concurrent updates using techniques ranging from version vectors to read write dependency checks This lecture explores the choices faced in designing a replication protocol with particular emphasis on meeting the needs of mobile applications It presents the inherent trade offs and implicit assumptions in alternative designs The discussion is grounded by including case studies of research and commercial systems including Coda Ficus Bayou Sybase s iAnywhere and Microsoft s Sync Framework
