**Advanced Distance Sampling** S. T. Buckland, D. R. Anderson, K. P. Burnham, J. L. Laake, D. L. Borchers, L. Thomas, 2004-08-19

This advanced text focuses on the uses of distance sampling to estimate the density and abundance of biological populations. It addresses new methodologies, new technologies, and recent developments in statistical theory and is the follow-up companion to *Introduction to Distance Sampling* (OUP, 2001). In this text, a general theoretical basis is established for methods of estimating animal abundance from sightings surveys, and a wide range of approaches to analysis of sightings data is explored. These approaches include modelling animal detectability as a function of covariates where the effects of habitat, observer, weather, etc. on detectability can be assessed; estimating animal density as a function of location, allowing for example, animal density to be related to habitat and other locational covariates; estimating change over time in populations, a necessary aspect of any monitoring programme; estimation when detection of animals on the line or at the point is uncertain, as often occurs for marine populations; or when the survey region has dense cover, survey design, and automated design algorithms allowing rapid generation of sound survey designs using geographic information systems; adaptive distance sampling methods which concentrate survey effort in areas of high animal density; passive distance sampling methods which extend the application of distance sampling to species that cannot be readily detected in sightings surveys but can be trapped; and testing of methods by simulation so that performance of the approach in varying circumstances can be assessed. Authored by a leading team, this text is aimed at professionals in government and environment agencies, statisticians, biologists, wildlife managers, conservation biologists, and ecologists, as well as graduate students studying the density and abundance of biological populations.

**Gromov-Hausdorff Distance for Quantum Metric Spaces/Matrix Algebras Converge to the Sphere for Quantum Gromov-Hausdorff Distance** Marc Aristide Rieffel, 2004. By a quantum metric space we mean a  $C^*$ -DEGREES algebra or more generally an order unit space equipped with a generalization of the usual Lipschitz seminorm on functions which one associates to an ordinary metric. We develop for compact quantum metric spaces a version of Gromov-Hausdorff distance.

**Comparative Genomics** Eric Tannier, 2010-10-13. The complexity of genome evolution has given birth to exciting challenges for computational biologists. A various range of algorithmic, statistical, mathematical techniques to elucidate the histories of molecules are developed each year and many are presented at the RECOMB satellite workshop on Comparative Genomics. It is a place where scientists working on all aspects of comparative genomics can share ideas on the development of tools and their application to relevant questions. This volume contains the papers presented at RECOMB CG 2010 held on October 9-11 in Ottawa. The field is still flourishing as seen from the papers presented this year: many developments enrich the combinatorics of genome rearrangements while gene order phylogenies are becoming more and more accurate thanks to a mixing of combinatorial and statistical principles associated with rapid and thoughtful heuristics. Several papers tend to refine the models of genome evolution and more and more genomic events can be modeled from single
