Distributed Constraint Logic Programming:

Distributed Constraint Logic Programming Ho-Fung Leung, 1993 This book presents the first attempt to combine concurrent logic programming and constraint logic programming It is divided into three parts In the first part a novel computation model called the multi Pandora model which is designed on the basis of the Pandora model is presented In the second part the distributed implementation schemes for Parlog Pandora and multi Pandora are presented Finally the author presents the distributed constraint solvers for finite domain constraints as well as the distributed constraint solvers in the domains of real numbers and Boolean rings which can be incorporated into the schemes presented in the second part to handle the ask and tell constraints [Constraint Satisfaction](#) Source Wikipedia, 2013-09 Please note that the content of this book primarily consists of articles available from Wikipedia or other free sources online Pages 62 Chapters Decomposition method Local consistency Constraint logic programming Complexity of constraint satisfaction Distributed constraint optimization Backjumping Constraint satisfaction problem Difference map algorithm Reasoning system Satisfiability Modulo Theories Constraint programming Concurrent constraint logic programming Constraint satisfaction dual problem Local search Constraint learning DPLL algorithm Hybrid algorithm Look ahead ECLiPSe Min conflicts algorithm Constraint Handling Rules SWI Prolog AC 3 algorithm Natural Constraint Language Allen s Interval Algebra Ordered graph Region connection calculus Constraint Composite Graph Davis Putnam algorithm WalkSAT Backmarking Spatial temporal reasoning Schaefer s dichotomy theorem Beaver bit vector decision procedure Mixed Set Programming Constraint inference Hidden transformation Nurse scheduling problem GNU Prolog Gecode Consensus dynamics Constraint graph Cassowary Hierarchical constraint satisfaction JaCoP Chaff algorithm Barrier function Basis pursuit Binary constraint Kaleidoscope Minion Regular constraint CHIP Excerpt In constraint satisfaction a decomposition method translates a constraint satisfaction problem into another constraint satisfaction problem that is binary and acyclic Decomposition methods work by grouping variables into sets and solving a subproblem for each set These translations are done because solving binary acyclic problems is a tractable problem Each structural restriction defined a measure of complexity of solving the problem after conversion this measure is called width Fixing a maximal allowed width is a way for identifying a subclass of constraint satisfaction problems Solving problems in this class is polynomial for most decompositions if this holds for a decomposition
