### Future Directions for NSF Advanced Computing Infrastructure to Support U.S. Science and Engineering in 2017-2020

National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Computer Science and Telecommunications Board, Committee on Future Directions for NSF Advanced Computing Infrastructure to Support U.S. Science in 2017-2020, 2016-07-14 Advanced computing capabilities are used to tackle a rapidly growing range of challenging science and engineering problems many of which are compute and data intensive as well Demand for advanced computing has been growing for all types and capabilities of systems from large numbers of single commodity nodes to jobs requiring thousands of cores for systems with fast interconnects for systems with excellent data handling and management and for an increasingly diverse set of applications that includes data analytics as well as modeling and simulation Since the advent of its supercomputing centers the National Science Foundation NSF has provided its researchers with state of the art computing systems The growth of new models of computing including cloud computing and publically available by privately held data repositories opens up new possibilities for NSF In order to better understand the expanding and diverse requirements of the science and engineering community and the importance of a new broader range of advanced computing infrastructure the NSF requested that the National Research Council carry out a study examining anticipated priorities and associated tradeoffs for advanced computing Future Directions for NSF Advanced Computing Infrastructure to Support U S Science and Engineering in 2017 2020 provides a framework for future decision making about NSF s advanced computing strategy and programs It offers recommendations aimed at achieving four broad goals 1 position the U S for continued leadership in science and engineering 2 ensure that resources meet community needs 3 aid the scientific community in keeping up with the revolution in computing and 4 sustain the infrastructure for advanced computing

communications technology ICT has dramatically changed how we work and live has had profound effects on nearly every sector of society has transformed whole industries and is a key component of U S global leadership A fundamental driver of advances in computing and ICT has been the fact that the single processor performance has until recently been steadily and dramatically increasing year over years based on a combination of architectural techniques semiconductor advances and software improvements Users developers and innovators were able to depend on those increases translating that performance into numerous technological innovations and creating successive generations of ever more rich and diverse products software services and applications that had profound effects across all sectors of society However we can no longer depend on those extraordinary advances in single processor performance continuing This slowdown in the growth of single processor computing performance has its roots in fundamental physics and engineering constraints multiple technological barriers have converged to pose deep research challenges and the consequences of this shift are deep and profound for computing and for the sectors of the economy that depend on and assume implicitly or explicitly ever increasing performance From a technology standpoint these challenges have led to heterogeneous multicore chips and a shift to alternate innovation axes that include but are not limited to improving chip performance mobile devices and cloud services As these technical shifts reshape the computing industry with global consequences the United States must be prepared to exploit new opportunities and to deal with technical challenges The New Global Ecosystem in Advanced Computing Implications for U S Competitiveness and National Security outlines the technical challenges describe the global research landscape and explore implications for competition and national security
