

Adaptive Spatial Alignment and Strategic Perceptual-Motor Control

When starting limb and target locations were simultaneously visible in a visuomotor task, performance during prism exposure was nearly perfect, but aftereffects were absent. When starting limb location was not visible, accurate exposure performance was slow to develop, but aftereffects were substantial. Adaptive spatial alignment of sensorimotor spaces and strategic perceptual-motor control to coordinate sensorimotor systems are distinct processes. However, realignment is dependent on whether the exposure task evokes control strategies that enable detection of misalignment. If the task can be performed solely by coding the visible difference between limb and target locations, misalignment detection is disabled. If movement is initiated by target location and then the limb is controlled by the visible difference between target and limb, the discordance between initialized and terminal locations enables misalignment detection and realignment.

When people perform a coordination task like target pointing with prismatic displacement of the visual field (e.g., Welch, 1978, 1986), performance error is initially large but quickly declines (e.g., Baily, 1972; Redding & Wallace, 1993a). Such direct evidence from performance during exposure to the prismatic distortion suggests that prism adaptation quickly becomes complete. Yet, aftereffect measures obtained by comparing postexposure with preexposure performance are slower to change and usually asymptotic far short of complete compensation for the distortion (e.g., Redding, 1973b; Redding & Wallace, 1976, 1993a). Such indirect evidence from aftereffects of exposure suggests that prism adaptation is slow and incomplete. This apparent contradiction can be understood by distinguishing two main classes of contributions to prism adaptation: adaptive spatial alignment and strategic perceptual-motor control.

Adaptive spatial alignment describes the class of parameter adjustments in the evolutionarily given spatial mapping functions or transformations that normally align corresponding positions¹ among the various spatial representations that serve perceptual-motor behavior (Paillard, 1991a; Shepard, 1981, 1989). Instances of such *realignments* include spatial mappings of eye-retina onto head, head onto body, arm onto shoulder, and leg onto trunk. Prism adapta-

tion is, in part, an experimental illustration of the ability to compensate for misalignments arising from the natural processes of growth (e.g., Bullock & Crossberg, 1988; Held & Bossom, 1961), normal drift (e.g., Howard, 1982; Robinson, 1976), and pathology (e.g., Goodale, Milner, Jakobson, & Carey, 1990; Jakobson & Goodale, 1989). Such parameter adjustment is characterized by complete transfer of training with a subset of positions to the entire domain of a transformation (Bedford, 1989, 1993a, 1993b; see also Paillard, 1991b). Thus, aftereffect measures obtained from criterion tasks that differ from the prism exposure task are ideally suited for isolating the changes in spatial mapping functions that contribute to prism adaptation.

Strategic perceptual-motor control describes the class of motor control processes that normally enable common action (coordination) of the various sensorimotor systems that serve perceptual-motor behavior (e.g., Paillard, 1991b; see also Grobstein, 1988; Sparks, 1988). Instances of such *strategic control* include task-dependent deployment of visual guidance, predictive feedforward control, error-corrective (on-line) feedback control, performance changes based on (off-line) knowledge of results, and associative feedforward learning. Prism adaptation, in part, illustrates the ability to accommodate ordinary imprecision in perceptual and motor processes, change in the environmental context in which a perceptual-motor task must be performed, and the esoteric variety of tasks required of the perceptual-motor system. The nature of strategic control is that it is task specific, displaying limited competence beyond the region of the task domain sampled during training (e.g., Marteniuk, 1992; Proteau, 1992). Thus, changes in performance of the expo-

¹By "position" we mean separate spatial representations of location and orientation (e.g., Shepard, 1984, 1989) that are independently affected by optical displacement of the visual field in a lateral direction and rotation (tilt) of the visual field in the frontal plane (Redding, 1973a, 1975).

Adaptive Spatial Alignment Gordon M. Redding, Benjamin Wallace, 2013-06-17 For most people prism adaptation is an amusing demonstration first experienced perhaps in an introductory psychology course This monograph relates this peculiar phenomenon to the larger context of cognitive science especially motor control and learning The first part sketches the background concepts necessary to understand the contribution of prism adaptation to the larger issue of adaptive perceptual motor performance including a review of the basic concepts of motor control and learning that enable strategic response in the prism adaptation situation the development of a hypothesis about spatial representation and spatial mapping and an introduction to the basic idea of adaptive spatial alignment and a contrasting view of perceptual and motor learning and a review of evidence for the involvement of nonassociative and associative learning in prism adaptation Directly concerned with data and theory in prism adaptation the second part presents an outline of prism adaptation methodology and a list of several empirical conclusions from previous research that constrained development of theoretical framework a theory of strategic perceptual motor control and learning which enables adaptive performance during prism exposure but does not directly involve adaptive spatial alignment an extension of the theory to include realignment processes which correct for the spatial misalignment among sensorimotor systems produced by prisms and a demonstration of how traditional issues in prism adaptation may be rephrased in terms of the present theoretical framework The last part of this volume reviews the research conducted in developing and testing the present theory of prism adaptation It summarizes the initial investigations employing a naturalistic exposure setting reports some more rigorous tests with an experimentally constrained research paradigm points out the more general theoretical issues raised by the authors analysis of prism adaptation and makes specific suggestions for further research within the prism adaptation paradigm

realignment processes which correct for the spatial misalignment among sensorimotor systems produced by prisms and a demonstration of how traditional issues in prism adaptation may be rephrased in terms of the present theoretical framework. The last part of this volume reviews the research conducted in developing and testing the present theory of prism adaptation. It summarizes the initial investigations employing a naturalistic exposure setting, reports some more rigorous tests with an experimentally constrained research paradigm, points out the more general theoretical issues raised by the authors' analysis of prism adaptation, and makes specific suggestions for further research within the prism adaptation paradigm.

Vision and Motor Control L. Proteau, D. Elliott, 1992-02-20. Since the classic studies of Woodworth (1899) the role of vision in the control of movement has been an important research topic in experimental psychology. While many early studies were concerned with the relative importance of vision and kinesthesia and/or the time it takes to use visual information, recent theoretical and technical developments have stimulated scientists to ask questions about how different sources of visual information contribute to motor control in different contexts. In this volume, articles are presented that provide a broad coverage of the current research and theory on vision and human motor learning and control. Many of the contributors are colleagues that have met over the years at the meetings and conferences concerned with human movement. They represent a wide range of affiliation and background, including kinesiology, physical education, neurophysiology, cognitive psychology, and neuropsychology. Thus, the topic of vision and motor control is addressed from a number of different perspectives. In general, each author sets an empirical and theoretical framework for their topic and then discusses current work from their own laboratory and how it fits into the larger context. A synthesis chapter at the end of the volume identifies commonalities in the work and suggests directions for future experimentation.

Plasticity in Sensory Systems Jennifer K. E. Steeves, Laurence R. Harris, 2012-12-17. Centered on three themes, this book explores the latest research in plasticity in sensory systems, focusing on visual and auditory systems. It covers a breadth of recent scientific study within the field, including research on healthy systems and diseased models of sensory processing. Topics include visual and visuomotor learning, models of how the brain codes visual information, sensory adaptations in vision and hearing as a result of partial or complete visual loss in childhood, plasticity in the adult visual system, and plasticity across the senses, as well as new techniques in vision recovery, rehabilitation, and sensory substitution of other senses when one sense is lost. This unique edited volume, the fruit of an International Conference on Plastic Vision held at York University, Toronto, will provide students and scientists with an overview of the ongoing research related to sensory plasticity and perspectives on the direction of future work in the field.

Geocoding Health Data Gerard Rushton, Marc P. Armstrong, Josephine Gittler, Barry R. Greene, Claire E. Pavlik, Michele M. West, Dale L. Zimmerman, 2007-11-19. In the past, disease pattern mapping depended on census tracts based on political units such as states and counties. However, with the advent of geographic information systems (GIS), researchers can now achieve a new level of precision and flexibility in geographic locating.
