Diesel Engine Experiments:

Some experiments on a diesel engine William Ernest Fisher, Edmund Baddeley Wood, 1910 *Some Experiments in Connexion with the Injection and Combustion of Fuel-oil in Diesel Engines* Charles John Hawkes, 1921 Diesel Engine Experiments with Oxygen Enrichment, Water Addition and Lower-grade Fuel, 1990 The concept of oxygen enriched air applied to reciprocating engines is getting renewed attention in the context of the progress made in the enrichment methods and the tougher emissions regulations imposed on diesel and gasoline engines An experimental project was completed in which a direct injection diesel engine was tested with intake oxygen levels of 21% 35% Since an earlier study indicated that it is necessary to use a cheaper fuel to make the concept economically attractive a less refined fuel was included in the test series Since a major objection to the use of oxygen enriched combustion air had been the increase in NO subscript x emissions a method must be found to reduce NO subscript x Introduction of water into the engine combustion process was included in the tests for this purpose Fuel emulsification with water was the means used here even though other methods could also be used The test data indicated a large increase in engine power density slight improvement in thermal efficiency significant reductions in smoke and particulate emissions and NO subscript x emissions controllable with the addition of water 15 refs 10 figs 2 tabs *Diesel Engine Cold-Starting Studies: Optically Accessible Engine Experiments and Modeling*, 1997 An experimental and numerical study was carried out to simulate the diesel spray breakup vaporization ignition and combustion during cold starting conditions This report summarizes the optical diagnostics and multi dimensional computation results for two single cylinder optically accessible engines The results showed that optically accessible engines provide very useful information for studying the diesel cold starting conditions which also provide a critical test for diesel combustion models The pre ignition chemistry showed great sensitivity to the compressed air temperature KIVA with a modified shell model responds accordingly to the change of inlet air temperatures and fuel injection parameters However other submodels do not have enough sensitivity to simulate the starting of diesel engine without careful validation and further improvements A method to compute the ignition delay in engines from data obtained in constant volume vessels was also developed The method accounts for the effect of variations in charge pressure and temperature on the formation of the chain carriers from the combustible mixture during the ID period A comparison is made between the computed ID and data obtained in a LABECO research engine under different ambient temperatures ranging from 200 to 100 C Single-cylinder Diesel Engine Experiments, Modeling and In-cycle Control with Heat-release Emphasis Claes-Göran Zander, 2010

Numerical and Experimental Investigation of Water Introduction Into DI Diesel Engine Combustion Peter Eckert, 2008 Im vorliegenden Band 3 2008 berichtet Herr Eckert über die Ergebnisse aus Untersuchungen zur Partikel und Stickoxidminimierung bei Dieselmotoren durch Wassereinbringung Das primäre Ziel ist dabei die innermotorische Reduzierung der thermischen Stickoxidbildung Es sind unterschiedliche Methoden der Wassereinbringung in den

dieselmotorischen Verbrennungsprozess möglich beispielsweise die Einspritzung von Wasser in das Ansaugsystem eine direkte Einspritzung von Wasser in den Brennraum sowie die Wassereinbringung mit Diesel Wasser Emulsionen Diese Massnahmen sind unter anderem bei dieselmotoren die zumindest teilweise mit Schwerol betrieben werden besonders interessant da dort klassische Methoden zur Schadstoffreduktion wie z B Abgasrückführung oder Abgasnachbehandlung nur mit erheblichem Aufwand eingesetzt werden können

Warm-up of a D.I. Diesel Engine Laurent Jarrier, J. C. Champoussin, R. Yu, D. Gentile, 2000 With the increasing efficiency of D I Diesel engines the heat power needed to warm the passengers compartment becomes too low during the warm up period So the temperature increase of oil and water may be accelerate This paper is devoted to the understanding of the phenomena involved in this process and their modeling A diesel engine enclosed in a calorimeter is mounted on a test bench and largely instrumented From the recorded data the instantaneous energy balance is set up for different running conditions Some general trends may be pointed out During the first minute 50% of the fuel energy is absorbed by the heat capacity of the heavy metallic components This part progressively decreases to the benefit of heat transferred to the coolant Furthermore for increasing distance from the combustion chamber in the block the rate of temperature rise decreases Concerning the oil temperature evolution it lags behind the water one In order to find efficient and cheaper solutions for industrial development a nodal model lumped capacity method of the engine thermal behavior is implemented and validated from the experimental data It gives numerical results closed to the experimental ones on a wide range of operating conditions until 3/4 of maximum speed and 1/2 load Then the model allows to evaluate the interest of competitive configurations to accelerate the warm up such as preheating of oil or water reduction of the losses to ambient air heat supply in coolant The main result is that an important flux flows towards the lower part of the block due to its great mass and lower temperature SAE website

Modelling Diesel Combustion P. A. Lakshminarayanan, Yoghesh V. Aghav, 2010-03-03 Phenomenology of Diesel Combustion and Modeling Diesel is the most efficient combustion engine today and it plays an important role in transport of goods and passengers on land and on high seas The emissions must be controlled as stipulated by the society without sacrificing the legendary fuel economy of the diesel engines These important drivers caused innovations in diesel engineering like re entrant combustion chambers in the piston lower swirl support and high pressure injection in turn reducing the ignition delay and hence the nitric oxides The limits on emissions are being continually reduced The fore the required accuracy of the models to predict the emissions and efficiency of the engines is high The phenomenological combustion models based on physical and chemical description of the processes in the engine are practical to describe diesel engine combustion and to carry out parametric studies This is because the injection process which can be relatively well predicted has the dominant effect on mixture formation and subsequent course of combustion The need for improving these models by incorporating new developments in engine designs is explained in Chapter 2 With model based control programs used in the Electronic Control Units of the engines

phenomenological models are assuming more importance now because the detailed CFD based models are too slow to be handled by the Electronic Control Units Experimental work is necessary to develop the basic understanding of the processes
