Differential Forms and Applications Manfredo P. Do Carmo, 1998-05-20 An application of differential forms for the study of some local and global aspects of the differential geometry of surfaces Differential forms are introduced in a simple way that will make them attractive to users of mathematics A brief and elementary introduction to differentiable manifolds is given so that the main theorem namely Stokes theorem can be presented in its natural setting The applications consist in developing the method of moving frames expounded by E Cartan to study the local differential geometry of immersed surfaces in R^3 as well as the intrinsic geometry of surfaces This is then collated in the last chapter to present Chern s proof of the Gauss Bonnet theorem for compact surfaces
