DIGITAL FILTER DESIGN TECHNIQUES. Charles M. Rader,Bernard Gold,LINCOLN LAB MASS INST OF TECH LEXINGTON.,1965 Digital filtering is the process of spectrum shaping using digital components as the basic elements Increasing speed and decreasing size and cost of digital components make it likely that digital filtering already used extensively in the computer simulation of analog filters will perform in real time devices the functions which are now performed almost exclusively by analog components In this paper using the z transform calculus several digital filter design techniques are reviewed and new ones are presented One technique can be used to design a digital filter whose impulse response is like that of a given analog filter another technique is suitable for the design of a digital filter meeting frequency response criteria A third technique yields digital filters with linear phase specified frequency response and controlled impulse response duration The effect of digital arithmetic on the behavior of digital filters is also considered Author

Analog and Digital Filter Design Steve Winder,2002-10-24 Unlike most books on filters Analog and Digital Filter Design does not start from a position of mathematical complexity It is written to show readers how to design effective and working electronic filters The background information and equations from the first edition have been moved into an appendix to allow easier flow of the text while still providing the information for those who are interested The addition of questions at the end of each chapter as well as electronic simulation tools has allowed for a more practical user friendly text Provides a practical design guide to both analog and digital electronic filters Includes electronic simulation tools Keeps heavy mathematics to a minimum
