Challenges and Opportunities in Orchid Ecology and Conservation Pavel Kindlmann,Tiiu Kull,Dennis Whigham,2023-08-02 Understanding diversity patterns and the effect of global change on abundance distribution patterns and species survival are of the most discussed topics in biodiversity research Species are disappearing worldwide mostly due to habitat loss but other factors like climate change are likely to increase in importance during the 21st century Thus one of the most worrying issues is that we still do not know the optimal abiotic and biotic requirements for population persistence of many of the still existing species which makes it very difficult if not impossible to make appropriate recommendations for their conservation in terms of proposing an effective management of their sites Analysis of these requirements is however strongly dependent on the taxonomic group considered and on life history strategies of the species that comprise the group

In this Research Topic we concentrate on this issue applied to orchids one of the most abundant groups of flowering plants with approximately 30 000 species They are classified among the most threatened groups worldwide Of the approximately 1000 species that have been evaluated almost 60% are threatened endangered or extinct For a few orchid species detailed records from monitoring efforts provide opportunities for comparative analyses of species declines through time However for most orchid species we still lack population data and there have been few studies that have focused on the environmental factors and species traits associated with the decline of orchid sites and species numbers
