Commutative Harmonic Analysis Iii Generalized Functions Applications:

Commutative Harmonic Analysis III V.P. Havin, N.K. Nikol'skij, 2012-12-06 The theory of generalized functions is a general method that makes it possible to consider and compute divergent integrals sum divergent series differentiate discontinuous functions perform the operation of integration to any complex power and carry out other such operations that are impossible in classical analysis Such operations are widely used in mathematical physics and the theory of differential equations where the ideas of generalized functions first arose in other areas of analysis and beyond The point of departure for this theory is to regard a function not as a mapping of point sets but as a linear functional defined on smooth densities This route leads to the loss of the concept of the value of function at a point and also the possibility of multiplying functions but it makes it possible to perform differentiation an unlimited number of times The space of generalized functions of finite order is the minimal extension of the space of continuous functions in which coordinate differentiations are defined everywhere In this sense the theory of generalized functions is a development of all of classical analysis in particular harmonic analysis and is to some extent the perfection of it The more general theories of ultradistributions or generalized functions of infinite order make it possible to consider infinite series of generalized derivatives of continuous functions

Commutative Harmonic Analysis III V.P. Havin, N.K. Nikol'skij, 2011-09-30 Aimed at readers who have learned the principles of harmonic analysis this book provides a variety of perspectives on this very important classical subject The authors have written a truly outstanding book which distinguishes itself by its excellent expository style

General Topology III A. V. Arhangel'skii, 2013-03-09 The problem of metrization of topological spaces has had an enormous influence on the development of general topology Singling out the basic topological components of metrizability has determined the main reference points in the construction of the classification of topological spaces These are primarily paracompactness collectionwise normality monotonic normality and perfect normality the concepts of a stratifiable space Moore space and u space point countable base and uniform base The method of covers has taken up a leading role in this classification Of paramount significance in the applications of this method have been the properties of covers relating to the character of their elements open covers closed covers the mutual disposition of these elements star finite point finite locally finite covers etc as well as the relations of refinement between covers simple refinement refinement with closure combinatorial refinement star and strong star refinement On this basis a hierarchy of properties of paracompactness type has been singled out together with the classes of spaces corresponding to them the most important of which is the class of paracompacta The behaviour of families of covers with respect to the topology of a space has important significance Here first and foremost is the notion of a refining family of covers a development which appears in several modifications and together with the notion of paracompactness plays a key role in metrization problems

Commutative Harmonic Analysis I V.P. Havin, N.K. Nikol'skij, 1991-08-15 This volume is the first in the series devoted to the commutative harmonic

analysis a fundamental part of the contemporary mathematics The fundamental nature of this subject however has been determined so long ago that unlike in other volumes of this publication we have to start with simple notions which have been in constant use in mathematics and physics Planning the series as a whole we have assumed that harmonic analysis is based on a small number of axioms simply and clearly formulated in terms of group theory which illustrate its sources of ideas However our subject cannot be completely reduced to those axioms This part of mathematics is so well developed and has so many different sides to it that no abstract scheme is able to cover its immense concreteness completely In particular it relates to an enormous stock of facts accumulated by the classical trigonometric harmonic analysis Moreover subjected to a general mathematical tendency of integration and diffusion of conventional intersubject borders harmonic analysis in its modern form more and more rests on non translation invariant constructions For example one of the most significant achievements of latter decades which has substantially changed the whole shape of harmonic analysis is the penetration in this subject of subtle techniques of singular integral operators

Algebraic Geometry II I.R. Shafarevich, 2013-11-22 This EMS volume consists of two parts The first part is devoted to the exposition of the cohomology theory of algebraic varieties The second part deals with algebraic surfaces The authors have taken pains to present the material rigorously and coherently The book contains numerous examples and insights on various topics This book will be immensely useful to mathematicians and graduate students working in algebraic geometry arithmetic algebraic geometry complex analysis and related fields The authors are well known experts in the field and I R Shafarevich is also known for being the author of volume 11 of the Encyclopaedia

Linear and Complex Analysis Alexei Alexandrov, Anton Baranov, Sergey Kislyakov, *Topology I* S.P. Novikov, 2013-06-29 Introduction In the present essay we attempt to convey some idea of the skeleton of topology and of various topological concepts It must be said at once that apart from the necessary minimum the subject matter of this survey does not include that subdiscipline known as general topology the theory of general spaces and maps considered in the context of set theory and general category theory Doubtless this subject will be surveyed in detail by others With this qualification it may be claimed that the topology dealt with in the present survey is that mathematical subject which in the late 19th century was called Analysis Situs and at various later periods separated out into various subdisciplines Combinatorial topology Algebraic topology Differential or smooth topology Homotopy theory Geometric topology With the growth over a long period of time in applications of topology to other areas of mathematics the following further subdisciplines crystallized out the global calculus of variations global geometry the topology of Lie groups and homogeneous spaces the topology of complex manifolds and algebraic varieties the qualitative topological theory of dynamical systems and foliations the topology of elliptic and hyperbolic partial differential equations Finally in the 1970s and 80s a whole complex of applications of topological methods was made to problems of modern physics in fact in several instances it would have been impossible to understand the essence of the real physical phenomena in question without the aid of concepts from topology

50 Years with Hardy Spaces Anton Baranov, Sergei Kisliakov, Nikolai Nikolski, 2018-03-28 Written in honor of Victor Havin
1933 2015 this volume presents a collection of surveys and original papers on harmonic and complex analysis function
spaces and related topics authored by internationally recognized experts in the fields It also features an illustrated scientific
biography of Victor Havin one of the leading analysts of the second half of the 20th century and founder of the Saint
Petersburg Analysis Seminar A complete list of his publications as well as his public speech Mathematics as a source of
certainty and uncertainty presented at the Doctor Honoris Causa ceremony at Link ping University are also included
