Developmental Neurobiology of Vision R. D. Freeman, 2012-12-06 This volume contains summaries of most of the invited presentations given by lecturers and participants at the NATO Advanced Study Institute Developmental Neurobiology of Vision held in Rethymnon Crete Greece 18-27 September 1978 The purpose of this meeting was to enable a relatively small international group of scientists and students to hold discussions and to present their views on current problems in the field It was intended that the results of the exchanges would be conveyed to others in the native countries of the participants An attempt was made to obtain broad representation of disciplines within the area of the Institute and this is reflected in the diversity of the chapters in this book Considerable interest has been generated in recent years concerning the development and plasticity of vision Perhaps not unexpectedly along with the high level of activity in this field there have been some controversial findings

Systems Approaches to Developmental Neurobiology Pamela A. Raymond, Stephen S. Easter Jr., Giorgio M. Innocenti, 2012-12-06

It is appropriate at the outset of this book to pose a question that was often asked of the organizers before the meeting took place and later among those who participated in the meeting What is meant by Systems Approaches in the study of developmental neurobiology The answer as we originally conceived it can be succinctly summarized by the word interactions That brief epithet was expanded during the general discussion portion of the meeting where the following definition was offered Systems approaches in developmental neurobiology are unified by attention to the emergent properties of the developing system under investigation and by a focus on the aspects of development of the nervous system that depend on interactions among its various elements be they molecular intracellular or multicellular As opposed to ignoring complexity or trying to wish it away those of us who utilize a systems approach embrace the principle that complexity is what makes the nervous system special We have come to recognize that wherever we look we find interactions which are to be probed and eventually understood Even the so called simple systems a term that has been used to describe many invertebrate preparations are embraced under the above definition since with further study it is becoming

increasing clear that such systems are not as simple as once thought We also include molecular genetics under the systems rubric After all genes regulate other genes which regulate others and so it goes

**Evolutionary Developmental Biology of the Cerebral Cortex** Gregory R. Bock, Gail Cardew, 2000-07-26 The cerebral cortex is the crowning achievement of evolution and the biological substrate of human mental capacities Using a comparative evolutionary developmental approach to the study of its origin helps to offer new insights into this complex and important problem The comparison of immature stages reveals features of evolution that are otherwise obstructed by the complexity of the mature brain and the analysis of development in terms of possible evolutionary events helps us to focus on the most biologically relevant mechanisms In this book leading experts in the fields of mammalian reptilian avian and amphibian brain development and from evolutionary biology tackle the fundamental question of the origin of the cerebral cortex The book includes critical examinations of methods used to study homology in the central nervous system and methods used in cladistic analysis Recent data on the earliest generated transient cells in the mammalian reptilian avian and amphibian forebrain are discussed as are possible homologies based on specific connectional analysis The various hypotheses on the origin of the mammalian isocortex are discussed in detail and new results are presented on cortical organization in reptiles birds marsupials monotremes and other species *Early Visual Development, Normal and Abnormal* Kurt Simons, 1993 Since the 1960s there has been great expansion of our understanding of the development of vision in early life New techniques and technologies have provided unprecedented insights into the function of all the components of the visual system optical motor and neural during this formative period These insights have come from neurophysiological studies of animal models electrophysiological and psychophysical studies of infants and young children and clinical and other studies of such abnormal developmental conditions as amblyopia lazy eye nystagmus and prematurity Despite this broadened scope of study of early visual development there has never been a comprehensive single text or reference work definitively reviewing the entire field This important work provides such an overview Prepared under the auspices of the Committee on Vision of the National Academy of Sciences National Research Council its in depth chapters are written by world authorities Equally useful to the student or clinician looking for a convenient introduction to the field and to the researcher in seeking explicit detail this book provides a new degree of integration of this diverse field
