Active Perception:

Active Perception Yiannis Aloimonos, 2013-05-13 This book defines the emerging field of Active Perception which calls for studying perception coupled with action. It is devoted to technical problems related to the design and analysis of intelligent systems possessing perception such as the existing biological organisms and the seeing machines of the future. Since the appearance of the first technical results on active vision, researchers began to realize that perception and intelligence in general is not transcendental and disembodied. It is becoming clear that in the effort to build intelligent visual systems, consideration must be given to the fact that perception is intimately related to the physiology of the perceiver and the tasks that it performs. This viewpoint, known as Purposive Qualitative or Animate Vision, is the natural evolution of the principles of Active Vision. The seven chapters in this volume present various aspects of active perception, ranging from general principles and methodological matters to technical issues related to navigation, manipulation, recognition, learning, planning, reasoning, and topics related to the neurophysiology of intelligent systems. [Active Perception and Robot Vision](#)

Arun K. Sood, Harry Wechsler, 2012-12-06 Intelligent robotics has become the focus of extensive research activity. This effort has been motivated by the wide variety of applications that can benefit from the developments. These applications often involve mobile robots, multiple robots working and interacting in the same work area, and operations in hazardous environments like nuclear power plants. Applications in the consumer and service sectors are also attracting interest. These applications have highlighted the importance of performance, safety, reliability, and fault tolerance. This volume is a selection of papers from a NATO Advanced Study Institute held in July 1989 with a focus on active perception and robot vision. The papers deal with such issues as motion understanding, 3-D data analysis, error minimization, object and environment modeling, object detection and recognition, parallel and real-time vision, and data fusion. The paradigm underlying the papers is that robotic systems require repeated and hierarchical application of the perception-planning-action cycle. The primary focus of the papers is the perception part of the cycle. Issues related to complete implementations are also discussed. **Active Perception Vs. Passive Perception**

Farzin Forouzani Fard, 2024-01-14 In the vast expanse of human understanding, few domains captivate and baffle as much as the interplay between artificial intelligence (AI) and the intricacies of human psychology. It signifies the merging of two separate realms, each teeming with its unique complexities, mysterious enigmas, and profound implications. Our journey through this book manifests as an exploration, a quest to reveal the intricate dimensions of intellect, language, emotions, cognition, character, and neuropsychology in this AI-defined era. *Active Perception* Nicholas J. Butko, 2010 Action is indelibly tied to perception, and good perception is vital to our survival. Action helps to inform organisms about the world they inhabit and to accrue information that aids in achieving their goals in a timely manner. In many computer vision applications, action plays no role in

understanding an image yet in natural situations action and perception are inextricably linked across all levels This thesis is about building machines that operate in real time in the real world using actions to aid perception In the chapters of this thesis there are many examples of active perception domains each with challenging problems We analyze these problems mathematically propose solutions and evaluate their performance in real world conditions In the process we explore a robust mathematical foundation for understanding active perception and develop many techniques for practical analysis

how to apply methods of high level computer vision and fuzzy logic to the guidance and control of the mobile robot The book introduces a knowledge based approach to vision modeling for robot guidance where advantage is taken of constraints of the robot's physical structure the tasks it performs and the environments it works in This facilitates high level computer vision algorithms such as object recognition at a speed that is sufficient for real time navigation The text presents algorithms that exploit these constraints at all levels of vision from image processing to model construction and matching as well as shape recovery These algorithms are demonstrated in the navigation of a wheeled mobile robot

Active Perception in the History of Philosophy José Filipe Silva, Mikko Yrjönsuuri, 2014-03-18 The aim of the present work is to show the roots of the conception of perception as an active process tracing the history of its development from Plato to modern philosophy The contributors inquire into what activity is taken to mean in different theories challenging traditional historical accounts of perception that stress the passivity of percipients in coming to know the external world Special attention is paid to the psychological and physiological mechanisms of perception rational and non rational perception and the role of awareness in the perceptual process Perception has often been conceived as a process in which the passive aspects such as the reception of sensory stimuli were stressed and the active ones overlooked However during recent decades research in cognitive science and philosophy of mind has emphasized the activity of the subject in the process of sense perception often associating this activity to the notions of attention and intentionality Although it is recognized that there are ancient roots to the view that perception is fundamentally active the history remains largely unexplored The book is directed to all those interested in contemporary debates in the fields of philosophy of mind and cognitive psychology who would like to become acquainted with the historical background of active perception but for historical reliability the aim is to make no compromises
