BCR Signaling and B Cell Activation Wanli Liu,Pavel Tolar,Wenxia Song,Tae Jin Kim,2020-02-24      **Deciphering new molecular mechanisms of mast cell activation** Ulrich Blank,Marc Benhamou,2014-03-20 Mast cells are tissue localized cells that play an important role in immunity and inflammation Following an offensive event they act as cellular sensors that via the activation of cell surface receptors launch a cellular response culminating in the release of a whole set of inflammatory mediators and products This response is initially destined to restore tissue homeostasis but in case of chronic injury or deregulation also promotes pathology To further understand the action of mast cells in their environmental context it is necessary to decipher the molecular mechanisms of their activation as well as the ensuing cellular responses This will allow identification of new strategies to promote their beneficial actions or at the contrary to interfere with their pathological consequences While in the past many studies have focused on responses engaged by high affinity IgE receptor because of its implication in the allergic response it has become clear that mast cells can be activated by multiple types of receptors initiating an intense molecular crosstalk between receptors and signaling pathways that can either synergize antagonize and in some cases produce new types of responses Mast cells can indeed react with an astounding diverse array of cellular responses that sometimes are engaged selectively This Research Topic will focus on selected articles that shed some new light on the molecular mechanisms of mast cell activation the possible crosstalk between signaling pathways and the ensuing cellular responses that allow mast cells to act as cellular sensors in tissues      **Genetic and Epigenetic Control on Immune Responses Regulating Molecules in Cancer Development, Progression, and Treatment** Katherine Chiappinelli,Alejandro Villagra ,Lidia Karabon,2024-10-16 In line with recent evidence the development of cancer has been described as uncontrolled cell growth that results from gradual accumulation of genetic and epigenetic alterations involving aberrations in oncogenes tumor suppressor genes and defects in genes engaged in DNA repair As a result cancer cells acquire a neoplastic phenotype and tumor associated antigens TAAs are presented on their surface These target structures should be recognized by cells of the immune system However a sequence of events at the genetic and epigenetic level disturb immune cells and in consequence make them unable to eliminate cancer cells Both innate and adaptive immunity are mobilized against cancer cells In response to the appearance of cells with malignant transformation NK cells release perforin and granzyme causing direct cytolysis of the target cells They can also secrete pro inflammatory cytokines and in that way enhance the anticancer response The activity of NK cells is regulated by a variety of activating and inhibitory receptors including NKG2D KIR CD94 NKG2 heterodimers and natural cytotoxicity receptors TNF family ligands as well as co stimulatory receptors which recognize related molecules on target cells A fundamental trigger of the anticancer immune response is the recognition of TAAs by T cells via the major histocompatibility complex MHC which should be followed by signals from co stimulatory molecules Full activation of T lymphocytes requires a third signal provided by the presence of

cytokines and this leads to cell proliferation differentiation and secretion of chemokines and cytokines The effect is to drive the clonal expansion of the T cells directed against TAAs and to recruit other immune effector cells in order to enhance immune defense

**Biomedical Index to PHS-supported Research** ,1994    **Anaphylaxis and Hypersensitivity Reactions** Mariana C. Castells,2010-12-09 Despite wide recognition as a serious public health problem anaphylaxis and hypersensitivity reactions remain under recognized and under diagnosed This book fills the gaps in our understanding of the identification of triggers recognition of clinical presentations understanding of the natural history of these reactions and selection of treatment strategies including those focused on cellular and molecular targets The book provides a detailed examination of disease etiology pathogenesis and pathophysiology and their correlation to clinical practice Forefront knowledge of the mediators and mechanisms of anaphylaxis is covered with an emphasis on how new discoveries shape our current and emerging therapies

**The Natural Killer Cell** Claire E. Lewis,1992 The ability of an organism to combat infection by foreign particles and microbial pathogens is essential for its survival and evolutionary success Such efforts at immunity can take two forms A considerable number of works have been published which focus on the central role of antigen recognition and antibody structure and function in the host response to infection This volume however discusses the recent shift in focus towards the natural or innate immune system which consists of various cell types and factors These cells and factors can take part in immune responses without prior sensitization and have important modulatory effects on later specific responses This work reviews the biology and function of the natural killer cell covering
