

How am I doing?

Throughout the year I have completed titration, calorimetry, chromatography and volumetric experiments and investigations. This review will highlight what areas I have grown in and what areas improvement is needed.

Titration skill, strengths and weaknesses

Titration is a fundamental technique in chemistry that involves the gradual addition of a solution of known concentration to another solution of unknown concentration until a reaction is complete. Through my experience with titration, I have developed key personal competencies that have not only enhanced my understanding of this technique but also improved my overall scientific skills.

One of the most important competencies I have developed is precision. Titration requires careful measurement and accurate calculations to obtain reliable results. Through practice, I have learned to handle equipment with ease and accurately perform measurements. This competency has not only improved my titration skills but has also translated into other areas of my scientific work where precision is essential. Another competency that has been honed through titration is problem-solving. During the process, unexpected challenges may arise, such as colour changes that are difficult to detect or sudden changes in pH. These situations require quick thinking and analytical skills to troubleshoot and find solutions. By encountering such problems during titrations, I have become more adept at identifying causes and devising strategies to overcome them.

Furthermore, titration has helped me develop patience and perseverance. The process can be time-consuming, especially when dealing with complex reactions or solutions with low concentrations. However, by remaining patient and persistent, I have learned the importance of carefully following each step in order to achieve accurate results.

It wasn't a new experiment to do as I had since completed it in secondary school, but I was not confident in doing it without a bit more prior research. So before doing the experiment, I watched a titration experiment on YouTube to ensure I had a clear understanding of what I was supposed to do and also made sure my method was easy but thorough enough to do the experiment accurately. One thing that I could've done better was taking out the stop cone as I kept forgetting to take it out which made my results unreliable since there was excess solution dripping from the cone. That investigation helped me when I had a unit 4 assignment which was to determine the vitamin C content in fresh fruit juice and fruit juice from concentration using titration. I was confident in my titration skills during this experiment as I had extensive practice from my unit 3 assignment. That allowed me to complete the experiment much faster as I knew what I was doing and what safety protocols needed to be followed. By observing others' techniques, I identified areas for improvement and gained inspiration from their successes, for example, the idea of putting the stand on the chair to be able to read the meniscus correctly was observed by another peer doing the same experiment. Furthermore, peer evaluation fosters healthy competition, motivating individuals to strive for excellence.

In conclusion, titration has provided me with valuable personal competencies including precision, problem-solving skills, patience, and perseverance. These competencies are not only applicable to chemistry but can be transferred to various aspects of life where attention to detail, analytical thinking, resilience, and determination are required for success.

How can I apply the abilities I acquired via my practical work to other aspects of my current or upcoming studies?

Due to its connections to my chemistry coursework, this experiment greatly aided my other academic pursuits. This gave me heavy knowledge that, combined with my other research, benefited me greatly in the long run. This experiment ties into both my present goals and my future goals because it relates to chemistry,
