Algebraic Frames for the Perception-Action Cycle Gerald Sommer, Jan J Koenderink, 2014-01-15 This book constitutes the refereed proceedings of the Second International Workshop on Algebraic Frames for the Perception Action Cycle AFPAC 2000 held in Kiel Germany in September 2000 The 20 regular papers presented together with seven invited papers were carefully reviewed and selected for inclusion in the book Among the topics addressed are action representation analysis perception action structure colorimetry motion modeling spatio temporal structures geometric transformations Clifford algebras geometric algebra illumination changes contact modeling wavelets adaptive system behaviour kinematics hyperharmonic signal analysis motion estimation geodesic contours etc

Algebraic Frames for the Perception-Action Cycle Gerald Sommer, Jan J. Koenderink, 1997-08-27 The book constitutes the refereed proceedings of the International Workshop on Algebraic Frames for the Perception Action Cycle AFPAC 97 held in Kiel Germany in September 1997 The volume presents 12 revised full papers carefully reviewed and selected for inclusion in the book Also included are 10 full invited papers by leading researchers in the area providing a representative state of the art assessment of this rapidly growing field The papers are organized in topical sections on PAC systems low level and early vision recognition of visual structure processing of 3D visual space representation and shape perception inference and action and visual and motor neurocomputation

Algebraic Frames for the Perception-Action Cycle Gerald Sommer, Yehoshua Y. Zeevi, 2000-09-01 This volume presents the proceedings of the 2nd International Workshop on Algebraic Frames for the Perception and Action Cycle AFPAC 2000 held in Kiel Germany 10-11 September 2000 The presented topics cover new results in the conceptualization design and implementation of visual sensor based robotics and autonomous systems Special emphasis is placed on the role of algebraic modelling in the relevant disciplines such as robotics computer vision theory of multidimensional signals and neural computation The aims of the workshop are twofold first discussion of the impact of algebraic embedding of the task at hand on the emergence of new qualities of modelling and second facing the strong relations between dominant geometric problems and algebraic modelling The first workshop in this series AFPAC 97 inspired several groups to initiate new research programs or to intensify ongoing research work in this field and the range of relevant topics was consequently broadened The approach adopted by this workshop does not necessarily fit the mainstream of worldwide research granting policy However its search for fundamental problems in our field may very well lead to new results in the relevant disciplines and contribute to their integration in studies of the perception action cycle

Algebraic Frames for the Perception-action Cycle, 2000 [Geometric Computing with Clifford Algebras](#) Gerald Sommer, 2013-06-29 Clifford algebra then called geometric algebra was introduced more than a century ago by William K Clifford building on work by Grassmann and Hamilton Clifford or geometric algebra shows strong unifying aspects and turned out in the 1960s to be a most adequate formalism for describing different geometry related algebraic systems as specializations of one mother algebra in various subfields of physics and engineering Recent work outlines that Clifford algebra provides a universal and powerful algebraic framework for an elegant and coherent representation of various problems occurring in computer science signal processing neural computing image processing pattern recognition computer vision and robotics This monograph like anthology introduces the concepts and framework of Clifford algebra and provides computer scientists engineers physicists and mathematicians with a rich source of examples of how to work with this formalism

Geometric Algebra with Applications in Science and Engineering Eduardo Bayro Corrochano, Garret Sobczyk, 2011-06-28 The goal of this book is to present a unified mathematical treatment of diverse problems in mathematics physics computer science and engineering using geometric algebra Geometric algebra was invented by William Kingdon Clifford in 1878 as a unification and generalization of the works of Grassmann and Hamilton which came more than a quarter of a century before Whereas the algebras of Clifford and Grassmann are well known in advanced mathematics and physics they have never made an impact in elementary textbooks where the vector algebra of Gibbs Heaviside still predominates The approach to Clifford algebra adopted in most of the articles here was pioneered in the 1960s by David Hestenes Later together with Garret Sobczyk he developed it into a unified language for mathematics and physics Sobczyk first learned about the power of geometric algebra in classes in electrodynamics and relativity taught by Hestenes at Arizona State University from 1966 to 1967 He still vividly remembers a feeling of disbelief that the fundamental geometric product of vectors could have been left out of his undergraduate mathematics education Geometric algebra provides a rich general mathematical framework for the development of multilinear algebra projective and affine geometry calculus on a manifold the representation of Lie groups and Lie algebras the use of the horosphere and many other areas This book is addressed to a broad audience of applied mathematicians physicists computer scientists and engineers

Computational

Noncommutative Algebra and Applications Jim Byrnes, Gerald Ostheimer, 2006-01-28 The fusion of algebra analysis and geometry and their application to real world problems have been dominant themes underlying mathematics for over a century Geometric algebras introduced and classified by Clifford in the late 19th century have played a prominent role in this effort as seen in the mathematical work of Cartan Brauer Weyl Chevelley Atiyah and Bott and in applications to physics in the work of Pauli Dirac and others One of the most important applications of geometric algebras to geometry is to the representation of groups of Euclidean and Minkowski rotations This aspect and its direct relation to robotics and vision will be discussed in several chapters of this multi authored textbook which resulted from the ASI meeting Moreover group theory beginning with the work of Burnside Frobenius and Schur has been influenced by even more general problems As a result general group actions have provided the setting for powerful methods within group theory and for the use of groups in applications to physics chemistry molecular biology and signal processing These aspects too will be covered in detail With the rapidly growing importance of and ever expanding conceptual and computational demands on signal and image processing in remote sensing computer vision medical image processing and biological signal processing and on neural and quantum computing geometric algebras and computational group harmonic analysis the topics of the book have emerged as key tools The list of authors includes many of the world s leading experts in the development of new algebraic modeling and signal representation methodologies novel Fourier based and geometric transforms and computational algorithms required for realizing the potential of these new application fields The intention of this textbook is share their profound wisdom with the many future stars of pure and computational noncommutative algebra A key feature of both the meeting and the book will be their presentation of problems and applications that will shape the twenty first century computational technology base
