experiencing some of the most rapid and severe climate change on earth Over the next 100 years climate change is expected to accelerate contributing to major physical ecological social and economic changes many of which have already begun Changes in arctic climate will also affect the rest of the world through increased global warming and rising sea levels The volume addresses the following major topics Research results in observing aspects of the Arctic climate system and its processes across a range of time and space scales Representation of cryospheric atmospheric and oceanic processes in models including simulation of their interaction with coupled models Our understanding of the role of the Arctic in the global climate system its response to large scale climate variations and the processes involved

Satellite-based Estimates of Sea Ice Volume Flux: Applications to the Fram Strait Region Gunnar Spreen, 2008-08-04 Doctoral Thesis Dissertation from the year 2008 in the subject Geography Earth Science Physical Geography Geomorphology Environmental Studies grade 1 0 University of Hamburg Institut f r Meereskunde language English abstract The sea ice export out of the Arctic Ocean through Fram Strait into the Greenland Sea is the single largest source of freshwater in the Nordic Seas and therefore of spezial importance for the hydrological cycle of the North Atlantic On its way south the exported sea ice melts and thereby modifies the stratification of the ocean surface mixed layer which in turn influences oceanic deep convection and water mass transformation processes in the Nordic Seas and thus impact global ocean thermohaline circulation The lack of spatial sea ice thickness information has been one of the weaknesses for previous existing methods to determine the sea ice export In this study a new method to obtain the sea ice volume flux exclusively from satellite measurements is presented Previous estimates of the sea ice volume flux relayed on ice draft measurements of a single Upward Looking Sonar ULS in the Greenland Sea The GLAS laser altimeter onboard the ICESat satellite launched in 2003 offers for the first time the opportunity to obtain the spatial sea ice thickness distribution up to 86 N latitude In this study a method to determine the sea ice freeboard from ICESat altimeter data is developed and applied to nine ICESat measurement periods between 2003 and 2007 Assuming hydrostatic balance and by utilization of further satellite in situ and climatological data these sea ice freeboard measurements are converted to sea ice thickness maps of the Fram Strait region The satellite based ice thickness estimates are combined with sea ice area and sea ice drift as retrieved from AMSR E microwave radiometer measurements at 89GHz to obtain the sea ice volume flux The errors of the input quantities and the final sea ice volume flux are assessed Using this method the spatial sea ice volume flux distribution is obtained from satellite observations for the first time The Fram Strait sea ice volume flux is further investigated by calculating a monthly sea ice volume flux time series between January 2003 and April 2007 Summer months have to be disregarded due to missing sea ice drift data The sea ice volume flux shows large interannual and seasonal variability A mean monthly Fram Strait sea ice volume flux of 248 90 km³ month with respective minimum and maximum values of 112 km³ month May 2003 and 484 km³ month December 2004 was found
