Buchsbaum, Jack Snoeyink, 2003-06-30 This book constitutes the thoroughly refereed post proceedings of the Third International Workshop on Algorithm Engineering and Experimentation ALENEX 2001 held in Washington DC USA in January 2001 The 15 revised full papers presented together with the abstracts of three invited presentations have gone through two rounds of reviewing and revision and were selected from 31 submissions Among the topics addressed are heuristics for approximation network optimization TSP randomization sorting information retrieval graph computations tree clustering scheduling network algorithms point set computations searching and data mining *Algorithm Engineering and Experimentation* Michael T. Goodrich, Catherine C. McGeoch, 1999-01-01 Symmetric multiprocessors SMPs dominate the high end server market and are currently the primary candidate for constructing large scale multiprocessor systems Yet the design of efficient parallel algorithms for this platform currently poses several challenges The reason for this is that the rapid progress in microprocessor speed has left main memory access as the primary limitation to SMP performance Since memory is the bottleneck simply increasing the number of processors will not necessarily yield better performance Indeed memory bus limitations typically limit the size of SMPs to 16 processors This has at least two implications for the algorithm designer First since there are relatively few processors available on an SMP any parallel algorithm must be competitive with its sequential counterpart with as little as one processor in order to be relevant Second for the parallel algorithm to scale with the number of processors it must be designed with careful attention to minimizing the number and type of main memory accesses In this paper we present a computational model for designing efficient algorithms for symmetric multiprocessors We then use this model to create efficient solutions to two widely different types of problems linked list prefix computations and generalized sorting Both problems are memory intensive but in different ways Whereas generalized sorting algorithms typically require a large number of memory accesses they are usually to contiguous memory locations By contrast prefix computation algorithms typically require a more modest quantity of memory accesses but they are usually to non contiguous memory locations

Algorithm Engineering Lasse Kliemann, Peter Sanders, 2016-11-11 Algorithm Engineering is a methodology for algorithmic research that combines theory with implementation and experimentation in order to obtain better algorithms with high practical impact Traditionally the study of algorithms was dominated by mathematical worst case analysis In Algorithm Engineering algorithms are also implemented and experiments conducted in a systematic way sometimes resembling the experimentation processes known from fields such as biology chemistry or physics This helps in counteracting an otherwise growing gap between theory and practice
