Advances In Adaptive Control:

Advances in Adaptive Control Kumpati S. Narendra, Romeo Ortega, 1991 *Advances in Adaptive Control* , **Adaptive Control** Dianwei Qian, 2018-03 Adaptive control is the control method used by a controller which must adapt to a controlled system with parameters which vary or are initially uncertain An adaptive control system utilizes on line identification of which either system parameter or controller parameter which does not need a priori information about the bounds on these uncertain or time varying parameters These approaches consider their control design in the sense of Lyapunov Besides there are still some branches by combining adaptive control and other control methods i e nonlinear control methods intelligent control methods and predict control methods to name but a few Addresses some original contributions reporting the latest advances in adaptive control It aims to gather the latest research on state of the art methods applications and research for the adaptive control theory and recent new findings obtained by the technique of adaptive control Apparently the book cannot include all research topics Different aspects of adaptive control are explored Chapters includes some new tendencies and developments in research on a adaptive formation controller for multi robot systems L1 adaptive control design of the the longitudinal dynamics of a hypersonic vehicle model adaptive high gain control of biologically inspired receptor systems adaptive residual vibration suppression of sigid flexible coupled systems neuro hierarchical sliding mode control for under actuated mechanical systems neural network adaptive PID control design based on PLC for a water level system and fuzzy based design of networked control systems with random time delays and packet dropout in the forward communication channel **Advances of Adaptive Control and Signal Processing Methods for Industrial Control** ,2010 Advances in Adaptive Control Theory Tansel Yucelen, 2011 In this dissertation we present new approaches to improve standard designs in adaptive control theory and novel adaptive control architectures We first present a novel Kalman filter based approach for approximately enforcing a linear constraint in standard adaptive control design One application is that this leads to alternative forms for well known modification terms such as e modification In addition it leads to smaller tracking errors without incurring significant oscillations in the system response and without requiring high modification gain We derive alternative forms of e and adaptive loop recovery ALR modifications Next we show how to use Kalman filter optimization to derive a novel adaptation law This results in an optimization based time varying adaptation gain that reduces the need for adaptation gain tuning A second major contribution of this dissertation is the development of a novel derivative free delayed weight update law for adaptive control The assumption of constant unknown ideal weights is relaxed to the existence of time varying weights such that fast and possibly discontinuous variation in weights are allowed This approach is particularly advantageous for applications to systems that can undergo a sudden change in dynamics such as might be due to reconfiguration deployment of a payload docking or structural damage and for rejection of external disturbance processes As a third and final contribution we develop a novel approach for extending all the methods developed in this dissertation to the

case of output feedback The approach is developed only for the case of derivative free adaptive control and the extension of the other approaches developed previously for the state feedback case to output feedback is left as a future research topic The proposed approaches of this dissertation are illustrated in both simulation and flight test

Adaptive Control with Recurrent High-order Neural Networks George A. Rovithakis, Manolis A. Christodoulou, 2012-12-06 The series *Advances in Industrial Control* aims to report and encourage technology transfer in control engineering The rapid development of control technology has an impact on all areas of the control discipline New theory new controllers actuators sensors new industrial processes computer methods new applications new philosophies new challenges Much of this development work resides in industrial reports feasibility study papers and the reports of advanced collaborative projects The series offers an opportunity

for researchers to present an extended exposition of such new work in all aspects of industrial control for wider and rapid dissemination Neural networks is one of those areas where an initial burst of enthusiasm and optimism leads to an explosion of papers in the journals and many presentations at conferences but it is only in the last decade that significant theoretical work on stability convergence and robustness for the use of neural networks in control systems has been tackled George Rovithakis and Manolis Christodoulou have been interested in these theoretical problems and in the practical aspects of neural network applications to industrial problems This very welcome addition to the Advances in Industrial Control series provides a succinct report of their research The neural network model at the core of their work is the Recurrent High Order Neural Network RHONN and a complete theoretical and simulation development is presented Different readers will find different aspects of the development of interest The last chapter of the monograph discusses the problem of manufacturing or production process scheduling

Advances in Parameter Estimation and Performance Improvement in Adaptive Control
Veronica Adetola, Martin Guay, 2009 The work presented in this chapter transcends beyond characterizing the parameter convergence rate A method is presented for computing the exact parameter value at a finite time selected according to the observed excitation in the system A smooth transition from a standard estimate to the FT estimate is proposed In the presence of unknown bounded disturbances the FT identifier converges to a neighbourhood of the true value whose size is dictated by the choice of the filter gain Moreover the procedure preserves the system's established closed loop properties whenever the required PE condition is not satisfied We also demonstrate how the finite time identification procedure can be used to improve the overall performance both transient and steady state of adaptive control systems in a very appealing manner The adaptive compensator guarantees exponential convergence of the estimation error provided a given PE condition is satisfied The convergence rate of the parameter estimator is directly proportional to the adaptation gain and a measure of the system's excitation The adaptive compensator is then combined with existing adaptive controllers to guarantee exponential stability of the closed loop system The application reported in Section 9 is just an example the adaptive compensator can easily be incorporated into other adaptive control algorithms

Adaptive Control of Solar Energy Collector Systems João M. Lemos, Rui Neves-Silva, José M. Igreja, 2014-06-04 This book describes methods for adaptive control of distributed collector solar fields plants that collect solar energy and deliver it in thermal form Controller design methods are presented that can overcome difficulties found in these type of plants they are distributed parameter systems i e systems with dynamics that depend on space as well as time their dynamics is nonlinear with a bilinear structure there is a significant level of uncertainty in plant knowledge Adaptive methods form the focus of the text because of the degree of uncertainty in the knowledge of plant dynamics Parts of the text are devoted to design methods that assume only a very limited knowledge about the plant Other parts detail methods that rely on knowledge of the dominant plant structure These methods are more plant specific but allow the improvement of performance Adaptive Control of Solar Energy Collector Systems demonstrates the dynamics of solar fields to be rich enough to present a challenge to the control designer while at the same time simple enough to allow analytic work to be done providing case studies on dynamics and nonlinear control design in a simple and revealing but nontrivial way The control approaches treated in this monograph can be generalized to apply to other plants modelled by hyperbolic partial differential equations especially process plants in which transport phenomena occur plants like dryers steam super heaters and even highway traffic An important example used repeatedly throughout the text is a distributed collector solar field installed at Plataforma Solar de Almeria located in southern Spain The control algorithms laid out in the text are illustrated with experimental results generated from this plant Although the primary focus of this monograph is solar energy collector the range of other systems which can benefit from the methods described will make it of interest to control engineers working in many industries as well as to academic control researchers interested in adaptive control and its applications
