Krakowiak,Santosh Shrivastava,2003-06-26 In 1992 we initiated a research project on large scale distributed computing systems LSDCS It was a collaborative project involving research institutes and universities in Bologna Grenoble Lausanne Lisbon Rennes Rocquencourt Newcastle and Twente The World Wide Web had recently been developed at CERN but its use was not yet as common place as it is today and graphical browsers had yet to be developed It was clear to us and to just about everyone else that LSDCS comprising several thousands to millions of individual computer systems nodes would be coming into existence as a consequence both of technological advances and the demands placed by applications We were excited about the problems of building large distributed systems and felt that serious rethinking of many of the existing computational paradigms algorithms and structuring principles for distributed computing was called for In our research proposal we summarized the problem domain as follows We expect LSDCS to exhibit great diversity of node and communications capability Nodes will range from mobile laptop computers workstations to supercomputers Whereas mobile computers may well have unreliable low bandwidth communications to the rest of the system other parts of the system may well possess high bandwidth communications capability To appreciate the problems posed by the sheer scale of a system comprising thousands of nodes we observe that such systems will be rarely functioning in their entirety **Advances in**

Object-Oriented Database Systems Asuman Dogac,M.Tamer Özsu,Alexandros Biliris,Timos Sellis,2013-11-09 Object oriented database management systems OODBMSs have generated significant excitement in the database community in the last decade This interest stems from a real need for data management support for what are called advanced application areas that are not well served by relational technology The case for object oriented technology has been made on three fronts First is the data modeling requirements of the new applications Some of the more important shortcomings of the relational systems in meeting the requirements of these applications include 1 Relational systems deal with a single object type a relation A relation is used to model different real world objects but the semantics of this association is not part of the database Furthermore the attributes of a relation may come only from simple and fixed data type domains numeric character and sometimes date types Advanced applications require explicit storage and manipulation of more abstract types e g images design documents and the ability for the users to define their own application specific types Therefore a rich type system supporting user defined abstract types is required 2 The relational model structures data in a relatively simple and flat manner Non traditional applications require more complex object structures with nested objects e g a vehicle object

Dittrich,1988-09-21 This volume collects papers presented at the 2nd International Workshop on Object Oriented Database Systems ooDBS II held at the Ebernburg near Bad M nster am Stein FRG in September 1988 It thus gives a comprehensive overview of the latest developments in this flourishing area of current database research Object oriented database systems have been approached with mainly two major intentions in mind namely to better support new application areas like CAD CAM office automation knowledge engineering and to overcome the impedance mismatch between data models and programming languages The notion of object orientation in database systems is thus a broader one than e g in the area of programming languages Structural object orientation provides for data model mechanisms that allow the direct representation and manipulation of highly structured entities behavioral object orientation cares for facilities to associate arbitrary user defined type specific operations with data entities finally full object orientation tries to combine the advantages of both categories Though data model concepts are the decisive feature of object oriented database systems numerous other system aspects have to be reconsidered or allow better solutions respectively in this light They include e g transactions implementation techniques optimization formalization the inclusion of rules and the integration with other systems A number of research prototypes and even some commercial systems are meanwhile available Both approaches to extend databases with object oriented capabilities and approaches to extend object oriented programming languages with database features have been and are being investigated **International Symposium on Memory Management** ,2004 **Advances in Databases and**
