

The background is a solid light blue color. It features several faint, stylized DNA double helix structures. One is prominent in the upper right, another in the lower left, and a third, more diffuse one in the lower center. The helices are composed of small circles representing nucleotides, connected by lines representing the sugar-phosphate backbone.

**Life in Action** Peter Joseph Farago, John R. Lagnado, 1973      *Biochemistry Explained* Thomas Millar, 2002-05-30  
Biochemistry Explained employs an innovative approach which has proven highly successful in the author's own classes. The author establishes a thorough understanding of the foundations of and common linkages between molecular structures and reactions so that eventual interpretation of complex biochemical pathways and reactions is easy. All of the major molecular structures and biochemical pathways are explained and for the most part these center on mammalian biochemistry. The text is supported by biochemical nomenclature and questions to bear in mind while reading. Higher learning sections are also provided for advanced students. Written in an informal conversational style, this textbook will serve as an invaluable resource for any student who is struggling with the standard texts and for postgraduate students who need to refresh their knowledge.

*Ecological Biochemistry* Gerd-Joachim Krauss, Dietrich H. Nies, 2015-01-12. The first stand-alone textbook for at least ten years on this increasingly hot topic in times of global climate change and sustainability in ecosystems. Ecological biochemistry refers to the interaction of organisms with their abiotic environment and other organisms by chemical means. Biotic and abiotic factors determine the biochemical flexibility of organisms which otherwise easily adapt to environmental changes by altering their metabolism. Sessile plants in particular have evolved intricate biochemical response mechanisms to fit into a changing environment. This book covers the chemistry behind these interactions bottom up from the atomic to the system's level. An introductory part explains the physico-chemical basis and biochemical roots of living cells leading to secondary metabolites as crucial bridges between organisms and the respective ecosystem. The focus then shifts to the biochemical interactions of plants, fungi, and bacteria within terrestrial and aquatic ecosystems with the aim of linking biochemical insights to ecological research also in human-influenced habitats. A section is devoted to methodology which allows network-based analyses of molecular processes underlying systems phenomena. A companion website offering an extended version of the introductory chapter on Basic Biochemical Roots is available at <http://www.wiley.com/go/KraussNies>.
