Circular Movement:

A Student's Guide Through the Great Physics Texts Kerry Kuehn, 2014-09-15 This book provides a chronological introduction to the sciences of astronomy and cosmology based on the reading and analysis of significant selections from classic texts such as Ptolemy's *The Almagest*, Kepler's *Epitome of Copernican Astronomy*, Shapley's *Galaxies and Lemaître's The Primeval Atom*. Each chapter begins with a short introduction followed by a reading selection. Carefully crafted study questions draw out key points in the text and focus the reader's attention on the author's methods, analysis, and conclusions. Numerical and observational exercises at the end of each chapter test the reader's ability to understand and apply key concepts from the text. *The Heavens and the Earth* is the first of four volumes in *A Student's Guide Through the Great Physics Texts*. This book grew out of a four-semester undergraduate physics curriculum designed to encourage a critical and circumspect approach to natural science while at the same time preparing students for advanced coursework in physics. This book is particularly suitable as a college-level textbook for students of the natural sciences, history, or philosophy. It also serves as a textbook for advanced high school students or as a thematically organized source book for scholars and motivated lay readers. In studying the classic scientific texts included herein, the reader will be drawn toward a lifetime of contemplation.

Galileo and the Equations of Motion Dino Boccaletti, 2015-08-17 This book is intended as a historical and critical study on the origin of the equations of motion as established in Newton's *Principia*. The central question that it aims to answer is whether it is indeed correct to ascribe to Galileo the inertia principle and the law of falling bodies. In order to accomplish this task, the study begins by considering theories on the motion of bodies from classical antiquity and especially those of Aristotle. The theories developed during the Middle Ages and the Renaissance are then reviewed with careful analysis of the contributions of, for example, the Merton and Parisian Schools and Galileo's immediate predecessors Tartaglia and Benedetti. Finally, Galileo's work is examined in detail, starting from the early writings. Excerpts from individual works are presented to allow the texts to speak for themselves and then commented upon. The book provides historical evidence both for Galileo's dependence on his forerunners and for the major breakthroughs that he achieved. It will satisfy the curiosity of all who wish to know when and why certain laws have been credited to Galileo.

A Source Book in Medieval Science Edward Grant, 1974 This Source Book explores a millennium of European scientific thought accompanied by critical commentary and annotation. Nearly half the selections appear for the first time in the vernacular. Representing science in the medieval sense, selections include alchemy, astrology, logic, and theology, as well as mathematics, physics, and biology.
