Dynamic Response of Coasts and Estuaries to Human Impacts Xiao Hua Wang, 2024-07-25 The coasts cover a diverse range of ecosystems within marine estuarine and freshwater environments They are some of the most heavily populated and visited areas and are also some of the most threatened natural habitats Coastal zones are critically important not only to the people who live there but for the health of the planet Many world estuaries and coast environments are under tremendous stress in response to global warming and the increased anthropogenic forcing Warmer waters rising sea levels tropical cyclones storm surges and flooding and coastal erosion are just some of the elements impacting coastal communities worldwide and transforming these environments Coastal hazards such as storm events with associated storm surges are increasing in frequency and intensity as are marine heatwaves that devastate coral reefs Human activities like sewage discharge overfishing navigation channel dredging land reclamation the construction of shipping ports and marine plastics are also responsible for coastal pollution and degradation Therefore a good understanding of the current state of coastal environments and lessons learnt from these human influences is extremely valuable to restore and protect these habitats and ecosystems from further environmental degradation and even catastrophe In this book case studies are used to tell a story about how these environments respond to severe human induced perturbations and what has gone right and

wrong from environmental and resource management point of view The readership of the book include high level undergraduate Oceanography students and workers from Coastal Engineering and Management *French-Japanese Symposium on Nuclear Structure Problems* Hideaki Otsu,2013 The book contains the papers presented in the French Japan Symposium on Nuclear Structure Problems held in January 2011 at RIKEN Wako Campus with 100 participants Based on the long history of collaboration between France and Japan in the field of nuclear physics various problems in recent and future studies are discussed Emphasis is on the structure of nuclei far from the stability reactions involving stable and unstable nuclei nuclear processes and properties in astrophysical interest synthesis of super heavy elements and instrumentation and accelerator projects Fundamentals of Cosmic Electrodynamics B.V. Somov,2012-12-06 Cosmic electrodynamics is the specific branch of plasma physics which studies electromagnetic phenomena mostly the role of electromagnetic forces in dynamics of highly conducting compressible medium in the solar interior and atmosphere solar wind in the Earth s magnetosphere and magnetospheres of other planets as well as pulsars and other astrophysical objects This textbook is written to be used at several different levels It is aimed primarily at beginning graduate students who are assumed to have a knowledge of basic physics Starting from the language of plasma physics from Maxwell s equations the author guides the reader into the more specialized concepts of cosmic electrodynamics The main attention in the book is paid to physics rather than maths However the clear mathematical image of physical processes in space plasma is presented and spelled out in the surrounding text There is not another way to work in modern astrophysics at the quantitative level The book will also be useful for professional astronomers and for specialists who investigate cosmic plasmas from space as well as for everybody who is interested in modern astrophysics
