**Abstract** The existence and dynamics of vortical structures in both homogeneous and inhomogeneous systems will be discussed. In particular the dynamics of monopolar and dipolar vortices in a plasma with nonuniform density and in a rotating fluid with varying Coriolis force is described. The role of vortical structures in connection with electrostatic plasma turbulence and the associated cross-field plasma transport will also be addressed.

### 1. Introduction

The existence of coherent vortical structures is a characteristic feature of two-dimensional or quasi-two-dimensional flows [1], such as planetary atmospheres and oceans, laboratory experiments with rotating or stratified fluids and strongly magnetized plasmas. The structures have life times much longer than their own period of internal rotation. They are dominating the large scale dynamics and are naturally of great importance in connection with the transport of mass, heat and momentum. Since they can trap particles and convect them over distances much larger than their own scale size they provide a transport mechanism, which in its nature is essentially different from classical diffusion dominated transport. Coherent structures are likely to form after external forcing and seem to be the universal outcome of any regular as well as irregular forcing in two-dimensional systems. They are easily excited in laboratory experiments in rotating [2,3] and stratified fluids [4]. They also appear spontaneously in two-dimensional turbulence [5] due to self-organization processes characterizing two-dimensional flows. The simultaneous conservation of energy and enstrophy (mean squared vorticity) for two-dimensional flows leads to an inverse spectral cascade, by which energy is cascading to smaller and smaller wavenumbers, whereas enstrophy is cascading to larger and larger wavenumbers. This effect is clearly demonstrated in high resolution numerical simulations of two-dimensional flows [6,7,8]. Vortical structures have also been excited in magnetized plasmas [9], where the low-frequency electrostatic dynamics is well described by a two-dimensional model, and the coalescence of like signed vortices, which is mediating the inverse cascade, was directly demonstrated [10]. In this connection the structures have often been termed convective cells [11]. Vortical structures are further found to appear spontaneously in low-frequency electrostatic turbulence [12,13] and to play an important role in connection with the plasma confinement by the magnetic field.

Rai Choudhuri,1998-11-26 A good working knowledge of fluid mechanics and plasma physics is essential for the modern astrophysicist This graduate textbook provides a clear pedagogical introduction to these core subjects Assuming an undergraduate background in physics this book develops fluid mechanics and plasma physics from first principles This book is unique because it presents neutral fluids and plasmas in a unified scheme clearly indicating both their similarities and their differences Also both the macroscopic continuum and microscopic particle theories are developed establishing the connections between them Throughout key examples from astrophysics are used though no previous knowledge of astronomy is assumed Exercises are included at the end of chapters to test the reader s understanding This textbook is aimed primarily at astrophysics graduate students It will also be of interest to advanced students in physics and applied mathematics seeking a unified view of fluid mechanics and plasma physics encompassing both the microscopic and macroscopic theories

**Lecture Notes on Turbulence and Coherent Structures in Fluids, Plasmas and Nonlinear Media** Michael Shats,Horst Punzmann,2006 This book is based on the lectures delivered at the 19th Canberra International Physics Summer School held at the Australian National University in Canberra Australia in January 2006 The problem of turbulence and coherent structures is of key importance in many fields of science and engineering It is an area which is vigorously

researched across a diverse range of disciplines such as theoretical physics oceanography atmospheric science magnetically confined plasma nonlinear optics etc Modern studies in turbulence and coherent structures are based on a variety of theoretical concepts numerical simulation techniques and experimental methods which cannot be reviewed effectively by a single expert The main goal of these lecture notes is to introduce state of the art turbulence research in a variety of approaches theoretical numerical simulations and experiments and applications fluids plasmas geophysics nonlinear optical media by several experts A smooth introduction is presented to readers who are not familiar with the field while reviewing the most recent advances in the area This collection of lectures will provide a useful review for both postgraduate students and researchers new to the advancements in this field as well as specialists seeking to expand their knowledge across different areas of turbulence research
