Hassanien, 2010-11-05. The success of the World Wide Web depends on the ability of users to store, process and retrieve digital information regardless of distance, boundaries, languages and domains of knowledge. The universality and exibility of the World Wide Web have also enabled the rapid growth of a variety of new services and applications based on human-machine interaction. The semantics of exchanged information and services should be useful not only for human-to-human communications but also in that machines would be able to understand and automatically process web content. Semantics give well defined meaning to web content and enable computers and people to work in cooperation. Today the crucial challenge becomes the development of languages to express information in a machine-processable format. Now more than ever, new advanced techniques and intelligent approaches are required to transform the Web into a universal reasoning and computing machine. Web intelligence attempts to deal with this challenge by exploiting information technologies and artificial intelligence approaches to design the next generation of web empowered systems and services. **Trust Management**, 2003

Holonic and Multi-agent Systems for Manufacturing, 2003 Advanced Information Networking and Applications Leonard Barolli, 2023-03-14. Networks of today are going through a rapid evolution and there are many emerging areas of information networking and their applications.
