more than enough computer power for our needs for word processing surfing the web or playing video games However the same cannot be said for applications that require large powerful machines Applications such as weather and climate prediction fluid flow for designing new airplanes or automobiles or nuclear plasma flow require as much computer power as we can provide and even that is not enough Today s machines operate at the teraflop level trillions of floating point operations per second and this book describes research into the petaflop region 1 015 FLOPS The six chapters provide an overview of current activities that will provide for the introduction of these machines in the years 2011 through 2015

   Advances in Computers ,2003 Since 1960 Advances in Computers has chronicled the constantly shifting theories and methods of Information Technology which greatly shapes our lives today This volume the 59th in the series presents two general themes The first 4 papers discuss tool use in developing software how groups work together to produce a product and why the very industries that need them often do NOT adopt such tools The fifth paper addresses a current hardware issue cache coherence As we build faster machines a way to increase performance is to have multiple CPUs working on solving the same problem This requires two or more CPUs to address the same memory at the same time The cache coherence problem is how to allow both machines to access the same memory without stepping on each others toes so that memory gets lost or corrupted In depth surveys and tutorials on new computer technology Well known authors and researchers in the field Broad overview of many important developments Extensive bibliographies with most chapters Four out of 5 chapters focus on software developemnt technology and should appeal to a software development organization or a university course on software development practices   Advances in Computer Architecture Glenford J.
