Introduction to Dynamic Programming Leon Cooper, Mary W. Cooper, 2016-06-06 Introduction to Dynamic Programming introduces the reader to dynamic programming and presents the underlying mathematical ideas and results as well as the application of these ideas to various problem areas A large number of solved practical problems and computational examples are included to clarify the way dynamic programming is used to solve problems A consistent notation is applied throughout the text for the expression of quantities such as state variables and decision variables This monograph consists of 10 chapters and opens with an overview of dynamic programming as a particular approach to optimization along with the basic components of any mathematical optimization model The following chapters discuss the application of dynamic programming to variational problems functional equations and the principle of optimality reduction of state dimensionality and approximations and stochastic processes and the calculus of variations The final chapter looks at several actual applications of dynamic programming to practical problems such as animal feedlot optimization and optimal scheduling of excess cash investment This book should be suitable for self study or for use as a text in a one semester course on dynamic programming at the senior or first year graduate level for students of mathematics statistics operations research economics business industrial engineering or other engineering fields

Applied Computational Economics and Finance Mario J. Miranda, Paul L. Fackler, 2004-08-20 This book presents a variety

of computational methods used to solve dynamic problems in economics and finance It emphasizes practical numerical methods rather than mathematical proofs and focuses on techniques that apply directly to economic analyses The examples are drawn from a wide range of subspecialties of economics and finance with particular emphasis on problems in agricultural and resource economics macroeconomics and finance The book also provides an extensive Web site library of computer utilities and demonstration programs The book is divided into two parts The first part develops basic numerical methods including linear and nonlinear equation methods complementarity methods finite dimensional optimization numerical integration and differentiation and function approximation The second part presents methods for solving dynamic stochastic models in economics and finance including dynamic programming rational expectations and arbitrage pricing models in discrete and continuous time The book uses MATLAB to illustrate the algorithms and includes a utilities toolbox to help readers develop their own computational economics applications

Applied Stochastic Models and Control for Finance and Insurance Charles S. Tapiero, 2012-12-06 Applied Stochastic Models and Control for Finance and Insurance presents at an introductory level some essential stochastic models applied in economics finance and insurance Markov chains random walks stochastic differential equations and other stochastic processes are used throughout the book and systematically applied to economic and financial applications In addition a dynamic programming framework is used to deal with some basic optimization problems The book begins by introducing problems of economics finance and insurance which involve time uncertainty and risk A number of cases are treated in detail spanning risk management volatility memory the time structure of preferences interest rates and yields etc The second and third chapters provide an introduction to stochastic models and their application Stochastic differential equations and stochastic calculus are presented in an intuitive

manner and numerous applications and exercises are used to facilitate their understanding and their use in Chapter 3 A number of other processes which are increasingly used in finance and insurance are introduced in Chapter 4 In the fifth chapter ARCH and GARCH models are presented and their application to modeling volatility is emphasized An outline of decision making procedures is presented in Chapter 6 Furthermore we also introduce the essentials of stochastic dynamic programming and control and provide first steps for the student who seeks to apply these techniques Finally in Chapter 7 numerical techniques and approximations to stochastic processes are examined This book can be used in business economics financial engineering and decision sciences schools for second year Master s students as well as in a number of courses widely given in departments of statistics systems and decision sciences

A Framework for Applied Dynamic Analysis in I.O. Ariel Pakes,2000 This paper outlines a framework which computes and analyzes the equilibria from a class of dynamic games The framework dates to Ericson and Pakes 1995 and allows for a finite number of heterogeneous firms sequential investments with stochastic outcomes and entry and exit The equilibrium analyzed is a Markov Perfect equilibrium in the sense of Maskin and Tirole 1988 The simplest version of the framework is supported by a publically accessible computer program which computes equilibrium policies for user specified primitives and then analyzes the evolution of the industry from user specified initial conditions We begin by outlining the publically accessible framework It allows for three types of competition in the spot market for current output specified up to a set of parameter values set by the user and has modules which allow the user to compare the industry structures generated by the Markov Perfect equilibrium to those that would be generated by a social planner and to those that would be generated by perfect collusion Next we review extensions that have been made to the simple framework These were largely made by other authors who needed to enrich the framework so that it could be used to provide a realistic analysis of particular applied problems The third section provides a simple way of evaluating the computational burden of the algorithm for a given set of primitives and then shows that computational constraints are still binding in many applied situations The last section reviews two computational algorithms designed to alleviate this computational constraint one of which is based on functional form approximations and the other on learning techniques similar to those used in the artificial intelligence literature
