

ASP.NET: Databases

Database Model

Entity Framework uses C# classes to define the database model. This is an in-memory representation of data stored in a database table. Several model classes combine to form the schema for the database. Each property maps to a column in a database table. The bottom line in the example shows a type of `Continent` which implies a relationship to another table.

```
using System;

public class Country
{
    public string ID { get; set; }
    public string ContinentID { get; set; }
    public string Name { get; set; }
    public int? Population { get; set; }
    public int? Area { get; set; }
    public DateTime? UnitedNationsDate
    { get; set; }

    public Continent Continent { get; set; }
}
}
```
