Biodiversity Conservation:

The Economics of Biodiversity Conservation K. N. Ninan, 2012 Economic valuation of biodiversity and ecosystem services is possibly the most powerful tool for halting the loss of biodiversity while maintaining incomes and livelihoods Yet rarely have such approaches been applied to tropical forest hotspots which house the vast majority of the planets plant and animal species This ground breaking work is the most comprehensive and detailed examination of the economics of environmental valuation and biodiversity conservation to date Focusing on the Western Ghats of India one of the top biodiversity hotspots in the world this volume looks at a cross section of local communities living within or near sanctuaries and reserve forests such as coffee growers indigenous people and farmers cum pastoralists to assess the use and non use values that people derive from tropical forests It also looks at the extent of their dependence on forests for various goods and services and examines their perceptions and attitudes towards biodiversity conservation and wildlife protection The book concludes with an assessment of the institutional alternatives and policies for promoting biodiversity conservation through economic valuation methods Related titles **Economics for Collaborative Environmental Management** 2005 1 84407 095 6 **Policy and Practice in Climate Change and Biodiversity Conservation** Asha Ramachandran, 2024-12-11 Climate change and biodiversity decline are the major challenges humankind is now facing with profound consequences for people and the ecosystems Continuous policy crafting is a prerequisite in mitigating climate change maladies as the world is witnessing an unprecedented eruption of climate induced catastrophes including heat waves hurricanes unseasonal rain and diseases spurred by climate change and globalization This book gives a bird s eye view of climate change biodiversity conservation and practical policy imperatives for mitigating inauspicious climate impacts in a globalized digital era The briefing looks at the relationships and describes policies that promote the interconnectedness of biodiversity and climate action which is essential for effective environmental stewardship This also conveys how improperly resolving one problem can make it harder to improve another The book is useful for academics policy makers scholars researchers health professionals and people involved in climate change research and mitigation strategies **Conservation Biology for All** Navjot S. Sodhi, Paul R. Ehrlich, 2010-01-07 *Conservation Biology for All* provides cutting edge but basic conservation science to a global readership A series of authoritative chapters have been written by the top names in conservation biology with the principal aim of disseminating cutting edge conservation knowledge as widely as possible Important topics such as balancing conservation and human needs climate change conservation planning designing and analyzing conservation research ecosystem services endangered species management extinctions fire habitat loss and invasive species are covered Numerous textboxes describing additional relevant material or case studies are also included The global biodiversity crisis is now unstoppable what can be saved in the developing world will require an educated constituency in both the developing and developed world Habitat loss is particularly acute in developing countries which is of special concern because it tends to be

these locations where the greatest species diversity and richest centres of endemism are to be found Sadly developing world conservation scientists have found it difficult to access an authoritative textbook which is particularly ironic since it is these countries where the potential benefits of knowledge application are greatest There is now an urgent need to educate the next generation of scientists in developing countries so that they are in a better position to protect their natural resources

Participatory Biodiversity Conservation Cristina Baldauf, 2020-05-13 It has long been claimed that addressing biodiversity loss and other environmental problems demands a better understanding of the social dimensions of conservation nevertheless the active participation of indigenous peoples and local communities IPLCs in conservation initiatives is still a challenging and somehow controversial issue In this context this book hopes to give voice to other perspectives related to biodiversity conservation beyond the fortress conservation model and emphasize one of the pillars of democracy popular participation It covers a wide range of environments and issues of special significance to the topic such as the expansion of culturally constructed niches protected areas and food security community based management participatory agroforestry productive restoration and biocultural conservation The contents also explore the limitations and shortcomings of participatory practices in protected areas the relationship between the global crisis of democracy and the decline of biocultural diversity as well as present current discussions on policy frameworks and governance systems for effective participatory biodiversity conservation In sum this book provides a comprehensive and realistic perspective on the social dimensions of conservation based on a series of interrelated themes in participatory biodiversity conservation The connections between biocultural conservation and the current political and economic environment are highlighted through the chapters and the book closes with a debate on ways to reconcile human welfare environmental justice and biodiversity conservation

Last Stand Randall A. Kramer, Carel van Schaik, Julie Johnson, 1997 During the past century tropical rain forests have been reduced to about half of their original area with a consequent loss of biodiversity This book takes a close look at how this has happened and what the consequences may be with an emphasis on those strategies that have proven successful in stemming the loss of plant and animal inhabitants It describes the use of protected areas such as sacred groves royal preserves and today's national parks which have long served to shield the delicate forest habitats for countless species Although programs for protecting habitats are under increasing attack this book argues that a system of protected areas must in fact be the cornerstone of all conservation strategies aimed at limiting the inevitable reduction of our planet's biodiversity Written by leading experts with years of experience the book integrates ecological economic and political perspectives on how best to manage tropical forests and their inhabitants throughout the world In addition to conservationists policy makers and ecologists the book will serve as a useful text in courses on tropical conservation

[OECD Environmental Performance Reviews: Greece 2020](#) OECD, 2020-10-05 Greece has undergone extensive reforms to cope with a deep recession over the past decade It has made progress in decoupling air pollutant emissions from GDP and improving the conservation status of natural habitats However the country faces challenges in managing waste and water and addressing air pollution

Handbook Robert B. McKinstry, 2006 Includes bibliographical references and index *Contested Nature* Steven R. Brechin, Peter R. Wilshusen, Crystal L. Fortwangler, Patrick C. West, 2012-02-01 How can the international conservation movement protect biological diversity while at the same time safeguarding the rights and fulfilling the needs of people particularly the poor *Contested Nature* argues that to be successful in the long term social justice and biological conservation must go hand in hand The protection of nature is a complex social enterprise and much more a process of politics and of human organization than ecology Although this political complexity is recognized by practitioners it rarely enters into the problem analyses that inform conservation policy Structured around conceptual chapters and supporting case studies that examine the politics of conservation in specific contexts the book shows that pursuing social justice enhances biodiversity conservation rather than diminishing it and that the fate of local peoples and that of conservation are completely intertwined

Biodiversity Islands: Strategies for Conservation in Human-Dominated Environments Florencia Montagnini, 2022-04-22 This book is intended to provide an overview for the identification and establishment of biodiversity islands It presents examples and case studies where the biodiversity islands approach is being used in a variety of locations and contexts worldwide It will contribute to design parameters on appropriate sizing and spatial distribution of biodiversity islands in order to be effective in conservation and regeneration across the landscape using integrated landscape management approaches This book is essential given the current worldwide trend of habitat destruction and the need to preserve biodiversity and its values The chapters are organized in five sections The first section provides the introduction Section 2 3 and 4 discuss the challenges and alternatives of establishment and management case studies across the globe safeguarding of the environmental economic and social benefits and the final section offers a conclusion The contributing authors present views from the academic the practitioner and the policymaker perspectives offering alternatives and suggestions for promoting strategies that support biodiversity conservation through intentionally designed frameworks for sustainable forest landscapes Readers will discover suggestions and concrete examples that can be used by a variety of stakeholders in various settings throughout the world This book is useful to researchers farmers foresters landowners land managers city planners and policy makers alike *Ethics in Biodiversity Conservation* Patrik Baard, 2021-11-28 This book examines the role of ethics and philosophy in biodiversity conservation The objective of this book is two fold on the one hand it offers a detailed and systematic account of central normative concepts often used but rarely explicated nor justified within conservation biology Such concepts include values both intrinsic instrumental and more recently relational rights and duties The second objective is to emphasize to environmental philosophers and applied ethicists the many interesting decision making challenges of biodiversity conservation The book argues that a nuanced account of instrumental values provides a powerful tool for reasoning about the values of biodiversity It also scrutinizes relational values the concept of rights of nature and risk and show how moral philosophy proves indispensable for these concepts Consequently it engages with recent suggestions on

normative aspects of biodiversity conservation and show the need for moral philosophy in biodiversity conservation The overriding aim of this book is to provide conservation biologists and policy makers with a systematic overview of concepts and assessments of the reasons for reaching prescriptive conclusions about biodiversity conservation This will prove instrumental in clarifying the role of applied ethics and a refined understanding of the tools it can provide This title will be of interest to students and scholars of conservation biology conservation policy environmental ethics and environmental philosophy

Designing Field Studies for Biodiversity Conservation Peter Feinsinger,2001-07-01 Anyone working in biodiversity conservation or field ecology should understand and utilize the common sense process of scientific inquiry observing surroundings framing questions answering those questions through well designed studies and in many cases applying results to decision making Yet the interdisciplinary nature of conservation means that many workers are not well versed in the methods of science and may misunderstand or mistrust this indispensable tool *Designing Field Studies for Biodiversity Conservation* addresses that problem by offering a comprehensible practical guide to using scientific inquiry in conservation work In an engaging and accessible style award winning tropical ecologist and teacher Peter Feinsinger melds concepts methods and intellectual tools into a unique approach to answering environmental questions through field studies Focusing on the fundamentals of common sense independent thinking and natural history he considers framing the question and designing the study interpreting and applying results through judicious use of statistical inference taking into account the natural history of plants animals and landscapes monitoring and assessing progress through approaches such as bioindicator species or species diversity measures helping other interested parties park guards local communities school teachers use scientific inquiry in addressing their own concerns Detailed appendixes explain technical issues while numerous sidebars and illustrations provide important background and thought provoking exercises Throughout the author challenges the reader to integrate conceptual thinking with on the ground practice in order to make conservation truly effective Feinsinger concentrates on examples from Latin America but stresses that the approach applies to local conservation concerns or field biology questions in any landscape *Designing Field Studies for Biodiversity Conservation* is an essential handbook for staff and researchers working with conservation institutions or projects worldwide as well as for students and professionals in field ecology wildlife biology and related areas

Biodiversity Conservation Charles A. Perrings,Karl-Göran Mäler,Carl Folke,C.S. Holling,Beng-Owe Jansson,2012-12-06

This book reports the more policy oriented results of the Biodiversity programme of the Royal Swedish Academy of Sciences Beijer Institute. The programme brought economists and ecologists together to consider where the problem in biodiversity loss really lies, what costs it has for society and how it might best be addressed. The results are strikingly different from those reported in other works on the subject. Biodiversity loss matters for all ecosystems, not just the megadiversity tropical forests. And it matters because it compromises the resilience and so the productivity of those systems. Biodiversity conservation requires the development of policies that change the behaviour of resource use everywhere, not just in parks and reserves. The book is required reading for researchers and policy makers alike. It canvasses options for the reform of park management, biodiversity conservation projects, property rights, tax, trade and price regimes that are within the reach of governments everywhere.

Biodiversity Conservation C. A. Perrings, 2012-12-06. This volume is one of a number of publications to carry the results of the first research programme of the Royal Swedish Academy of Science's Beijer Institute. The Institute was formed in 1991 in order to promote interdisciplinary research between natural and social scientists on the interdependency between economic and ecological systems. In its first research programme, the Biodiversity Programme, the Institute brought together a number of leading economists and ecologists to address the theoretical and policy issues associated with the current high rates of biodiversity loss in such systems, whether the result of direct depletion, the destruction of habitat or specialisation in agriculture, forestry and fisheries. This volume reports some of the more policy oriented work carried out under the programme. The broad aim of the programme is to further our understanding of the causes and consequences of biodiversity loss and to identify the options for addressing the problem. The results have turned out to be surprising to those who see biodiversity loss primarily in terms of the erosion of the genetic library. In various ways, the work carried out under the programme has already begun to alter our perception of where the problem in biodiversity loss lies and what policy options are available to deal with it. Indeed, the programme has provided a powerful set of arguments for reappraising not just the economic and ecological implications of biodiversity loss but the whole case for development based on specialisation of resource use.
