

Biological Control

Biological control, or biocontrol, refers to the use of natural organisms, like beneficial insects, mites, and micro-organisms (such as bacteria, fungi, viruses, and nematodes) to control pests.

PlantwisePlus advocates for lower-risk plant protection practices and products, including biocontrol, and supports farmers to implement these safer solutions to protect their crops and the environment.

Conservation
biocontrol

Crop management practices that maintain or increase populations of existing biocontrol agents, for example through providing shelter and more nectar plants.

Augmentative
biocontrol

The ongoing application of beneficial organisms to control pests, often using commercially available species.

Classical
biocontrol

The introduction of a non-native natural enemy to control an invasive pest. Once released, the agent self-replicates, providing permanent control.

Biological Control of Insects Pests Bret White, 2019-11-07 The Book e Biological Control of Insects Pestse illustrates how to control biologically the insect s pests It is important to know when numbers are great enough to justify artificial control and to evaluate the effectiveness of control The text has been organized very systematically to meet the long felt needs of increasingly large number of readers Biological control is the use of living organisms to maintain pest populations below damaging levels Natural enemies of arthropods fall into three major categories predators parasitoids and pathogens Predators catch and eat their prey Some common predatory arthropods include ladybird beetles carabid ground beetles staphylinid rove beetles syrphid hover files lacewings minute pirate bugs nabid bugs big eyed bugs and spiders Biological control is the beneficial action of parasites pathogens and predators in managing pests and their damage Biocontrol provided by these living organisms collectively known as natural enemies It is especially important for reducing the number of pest insects and mites Biological control is the beneficial action of parasites pathogens and predators in managing pests and their damage Biocontrol provided by these living organisms collectively called e natural enemies e is especially important for reducing the numbers of pest insects and mites Use of natural enemies for biological control of rangeland and wildland weeds is also effective Plant pathogens nematodes and vertebrates also have many natural enemies but this biological control is often harder to recognize less well understood and or more difficult to manage Conservation augmentation and classical biological control are tactics for harnessing natural enemies benefits The book will be highly useful for general entomologists students of agricultural entomology teachers and research scholars of zoology especially entomology

An Introduction to Biological Control A.P. Gutierrez, P.S. Messenger, R. van den Bosch, 2013-06-29 This volume is a revision of *Biological Control* by R van den Bosch and P S Messenger originally published by Intext Publishers In the revision I have attempted to

keep the original theme and to update it with current research findings and new chapters or sections on insect pathology microbial control of weeds and plant pathogens population dynamics integrated pest management and economics The book was written as an undergraduate text and not as a complete review of the subject area Various more comprehensive volumes have been written to serve as handbooks for the experts This book is designed to provide a concise overview of the complex and valuable field of biological control and to show the relationships to the developing concepts of integrated pest management Population regulation of pests by natural enemies is the major theme of the book but other biological methods of pest control are also discussed The chapter on population dynamics assumes a precalculus level knowledge of mathematics Author names of species are listed only once in the text but all are listed in the Appendix Any errors or omissions in this volume are my sole responsibility A P Gutierrez Professor of Entomology Division of Biological Control University of California Berkeley vii Acknowledgments Very special thanks must be given to my colleagues Professors C B Huffaker and L E Caltagirone for the very thorough review they provided and for the many positive suggestions they gave Dr Biological Control of Insect Pests and Weeds. Assistant Editor: Evert I. Schlinger. [By Various Authors. With Plates, and a Bibliography.]* Paul DeBach, 1964 Biological Insect Pest Suppression H. C. Coppel, J. W. Mertins, 2012-12-06 The subject area embraced by the term biological control in its classical sense is very broad indeed The term itself was apparently first used in 1919 by the late Harry S Smith and was then used specifically in reference to the suppression of insect populations by the actions of their indigenous or introduced natural enemies The California school of biological control specialists who followed in Smith's footsteps have traditionally differentiated natural biological control by indigenous natural enemies and applied biological control by man introduced natural enemies Subsequently the philosophy broadened beyond the original narrow concern with population suppression of insects and especially pest insects to embrace directed activities against mites or other arthropod pests various invertebrate and vertebrate pests weeds and organisms producing disease in humans or their domestic animals and plants The techniques used in these activities also multiplied beyond the original concern with natural enemies The subject area discussed in this book is at the same time broader and more restricted than that covered in other books on biological control On the one hand the treatment here is restrictive in that with rare exception we have limited ourselves to dealing only with ideas and examples involving the suppression of insect pests through human activity or intervention in the environment **Natural Enemies Handbook** Mary Louise Flint, Steve H.
