Biological Invasions in South Africa Brian W. van Wilgen, John Measey, David M. Richardson, John R. Wilson, Tsungai A. Zengeya, 2020-03-10 This open access volume presents a comprehensive account of all aspects of biological invasions in South Africa where research has been conducted over more than three decades and where bold initiatives have been implemented in attempts to control invasions and to reduce their ecological economic and social effects It covers a broad range of themes including history policy development and implementation the status of invasions of animals and plants in terrestrial marine and freshwater environments the development of a robust ecological theory around biological invasions the effectiveness of management interventions and scenarios for the future The South African situation stands out because of the remarkable diversity of the country and the wide range of problems encountered in its varied ecosystems which has resulted in a disproportionate investment into both research and management The South African experience holds many lessons for other parts of the world and this book should be of immense value to researchers students managers and policy makers who deal with biological invasions and ecosystem management and conservation in most other regions [Biological Invasions](#)

James A. Drake, 1989-09-04 The results of a probe initiated by the Scientific Committee on Problems of the Environment SCOPE into the ecological implications of invasions of animals plants and micro organisms focusing primarily on those species which have been successful invaders of non agricultural regions **Biological Invasions in Changing Ecosystems** João Canning-Clode, 2016-01-15 When organisms are deliberately or accidentally introduced into a new ecosystem a biological invasion may take place These so called invasive species may establish spread and ecologically alter the invaded community Biological invasions by animals plants pathogens or vectors are one of the greatest environmental and economic threats and along with habitat destruction a leading cause of global biodiversity loss In this book more than 50 worldwide invasion scientists cover our current understanding of biological invasions its impacts patterns and mechanisms in both aquatic and terrestrial systems *Biological Invasions* Wolfgang Nentwig, 2007-02-13 This new volume on Biological Invasions deals with both plants and animals differing from previous books by extending from the level of individual species to an ecosystem and global level Topics of highest societal relevance such as the impact of genetically modified organisms are interlinked with more conventional ecological aspects including biodiversity The combination of these approaches is new and makes compelling reading for researchers and environmentalists **Impact of Biological Invasions on Ecosystem Services** Montserrat Vilà, Philip E. Hulme, 2017-02-15 The book presents an analysis of the ecological economic and social threats posed by the introduction and spread of non native species It provides a comprehensive description of impacts of non native species from all five kingdoms of life across all ecosystems of the world New insights into the impacts arising from biological invasions are generated through taking an ecosystem services perspective This work highlights that management of biological invasions is needed not only to sustain biodiversity and the environment but also to safeguard productive sectors such as agriculture forestry and fisheries as well as to preserve human health and well being Causes and Consequences of Biological Invasions Andrew Suarez, 2000 **Biological Invasions of Ecosystem by Pests and Beneficial Organisms** Eizi Yano, E. Yano, 1999 *Biological Invasions in California Wetlands* Tom Dudley, 1995 **Quantitative Aspects of the Ecology of Biological Invasions** Royal Society (Great Britain). Discussion Meeting, H. L. Kornberg, 1987 Biological Invasions in Marine Ecosystems Gil Rilov, Jeffrey A. Crooks, 2008-11-12 Biological invasions are considered to be one of the greatest threats to the integrity of most ecosystems on earth This volume explores the current state of marine bioinvasions which have been growing at an exponential rate over recent decades Focusing on the ecological aspects of biological invasions it elucidates the different stages of an invasion process starting with uptake and transport through inoculation establishment and finally integration into new ecosystems Basic ecological concepts all in the context of bioinvasions are covered such as propagule pressure species interactions phenotypic plasticity and the importance of biodiversity The authors approach bioinvasions as hazards to the integrity of natural communities but also as a tool for better understanding fundamental ecological processes Important aspects of managing marine bioinvasions are also discussed as are many

informative case studies from around the world **Biological Invasions in the San Francisco Estuary** Andrew N. Cohen,1996 **ASSESSMENT AND CONTROL OF BIOLOGICAL INVASION RISKS** Fumito Koike,2006 Biological invasion an issue of growing importance due to the significant increase in international transportation and trade can disturb the balance of local ecosystems and even destroy them This collection of papers presented at the International Conference on Assessment and Control of Biological Invasion Risks held in August 2004 at Yokohama National University discusses risk assessment risk management and eradication It also includes contributions reporting on the current status of invasion and the properties of alien species in East Asia **Ecology of Biological Invasion in the Tropics** P. S. Ramakrishnan,1991 *Conceptual and Empirical Analyses of Biological Invasion* Ann Shryock McLain,1991 *Ecology of Biological Invasions of North America and Hawaii* Harold A. Mooney,James A. Drake,1989-11-13 The diversity of the earth s climates superimposed upon a complex configuration of physical features has provided the conditions for the evolution of a remarkable array of living things which are linked together into complex ecosystems The kinds of organisms comprising the ecosystems of the world and the nature of their interactions have constantly changed through time due to coevolutionary interactions along with the effects of a continually changing physical environment In recent evolutionary time there has been a dramatic and ever accelerating rate of change in the configuration of these ecosystems because of the increasing influence of human beings These changes range from subtle modifications caused by anthropogenically induced alterations in atmospheric properties to the total destruction of ecosystems Many of these modifications have provided the fuel food and fiber which have allowed the expansion of human populations Unfortunately there have been many unanticipated changes which accompanied these modifications which have had effects detrimental to human welfare including substantial changes in water and air quality For example the use of high sulfur coal to produce energy in parts of North America is altering the properties of freshwater lakes and forests because of acidification **Invasion Biology** Mark A. Davis,2009-01-29 With the exception of climate change biological invasions have probably received more attention during the past ten years than any other ecological topic Yet this is the first synthetic single authored overview of the field since Williamson s 1996 book Written fifty years after the publication of Elton s pioneering monograph on the subject *Invasion Biology* provides a comprehensive and up to date review of the science of biological invasions while also offering new insights and perspectives relating to the processes of introduction establishment and spread The book connects science with application by describing the health economic and ecological impacts of invasive species as well as the variety of management strategies developed to mitigate harmful impacts The author critically evaluates the approaches findings and controversies that have characterized invasion biology in recent years and suggests a variety of future research directions Carefully balanced to avoid distinct taxonomic ecosystem and geographic both investigator and species biases the book addresses a wide range of invasive species including protists invertebrates vertebrates fungi and plants which have been studied in marine freshwater and terrestrial

environments throughout the world by investigators equally diverse in their origins This accessible and thought provoking text will be of particular interest to graduate level students and established researchers in the fields of invasion biology community ecology conservation biology and restoration ecology It will also be of value and use to land managers policy makers and other professionals charged with controlling the negative impacts associated with recently arrived species

The Effects of Herbivory and Competition on 'Senecio Inaequidens' DC. (Asteraceae), an Invasive Alien Plant

Christoph Scherber, 2007-08 Diploma Thesis from the year 2002 in the subject Biology Ecology grade 1 0 A University of Rostock Institute for Botany language English abstract Since the end of the 19th century overall per capita mobility of humans has increased significantly leading to increased rates in human mediated transportation of animal and plant species The rapid spread of alien organisms however may lead to quick and unpredictable changes in ecosystems *Senecio inaequidens* DC Asteraceae is an invasive alien plant from South Africa that was first introduced to Europe 100 years ago and is characterized by an exceptionally fast rate of spread it contains pyrrolizidine alkaloids that are toxic to invertebrates livestock and humans In the study presented here laboratory greenhouse and field experiments on the biology of *Senecio inaequidens* were conducted in order to find out if and how herbivory and plant competition influence growth survival and reproduction of this plant Specifically the presence of vertebrate herbivores molluscs insects and plant competitors was experimentally manipulated using full factorial and split plot designs All experiments were performed at Imperial College Silwood Park about 30 km west of London UK Growth and fecundity of *Senecio inaequidens* were significantly affected by interspecific competition Vertebrate herbivory only had a significant effect when a closed vegetation cover was present On artificially disturbed plots *Senecio inaequidens* showed high capability to overcompensate for herbivory Mollusc herbivory significantly reduced fecundity of *S inaequidens* Different ecotypes of *Senecio inaequidens* showed different amounts of herbivore damage One of the most remarkable results of this study was that *Longitarsus jacobaeae* a native specialist leaf beetle freely colonized *Senecio inaequidens* indicating that native herbivores might be suitable biocontrol agents of invasive alien plants in the future Host switching
