### INTRODUCTION

Bees are the most economically valuable pollinators of different agricultural crops in the entire world (Great Britain: Department for Environment, 2011). Besides the production of honey, bees also play a significant role in crop pollination which is a vital element in agriculture, and food production (Stephen L. Buchmann, 1997). According to researchers, bees accomplish approximately 80% of all insect pollination (Keith S. Delaplane, 2016). Consequently, world food supply depends on the well-being of bees. Recent researches have shown that the rates of honey bee losses are increasing drastically, meaning that little is done to counter the problem of honey bee losses in the entire world. Therefore, proper mechanisms must be established to address this problem before it gets out of control, affecting severely the life of all living organisms on Earth.

## **Biodiversity Dynamics:**

**Biodiversity Dynamics** Michael L. McKinney, 1998 How will patterns of human interaction with the earth's ecosystem impact biodiversity loss over the long term not in the next ten or even fifty years but on the vast temporal scale dealt with by earth scientists The contributors to Biodiversity Dynamics bring together the cutting edge findings of a number of different fields that have traditionally had little crossover data from population biology community ecology comparative biology and paleontology are all presented Where paleontologists and ecologists have long had divergent perspectives Biodiversity Dynamics seeks a middle ground finding ways for both scientific communities to work together to comprehend the great biodiversity of the earth and how to preserve it for future generations

**On the Origins and Dynamics of Biodiversity: the Role of Chance** Alain Pavé, 2010-07-03 Chance is necessary for living systems from the cell to organisms populations communities and ecosystems It is at the heart of their evolution and diversity Long considered contingent on other factors chance both produces random events in the environment and is the product of endogenous mechanisms molecular as well as cellular demographic and ecological This is how living things have been able to diversify themselves and survive on the planet Chance is not something to which Life has been subjected it is quite simply necessary for Life The endogenous mechanisms that bring it about are at once the products and the engines of evolution and they also produce biodiversity These internal mechanisms veritable biological roulettes are analogous to the mechanical devices that bring about physical chance They can be modeled by analogous mathematical equations This opens the way of a global modeling of biodiversity dynamics but we need also to gather quantitative data in both the laboratory setting as well as in the field By examining biodiversity at all scales and all levels this book seeks to evaluate the breadth of our knowledge on this topical subject to propose an integrated look at living things to assess the role of chance in its dynamics in the evolutionary processes and also to imagine practical consequences on the management of living systems

**Biological Diversity** L. N. Petrov, 2003 One of the cornerstones of life's wonders is the vast array of species filling the planet From plants to animals to humans there is no shortage of beings to provide spice of life variety is said to be Periodically scientists announce the discovery of a new form of life so it seems as if Earth is capable of producing new species just to keep us on our toes At times the immense breadth of living things can even feel overwhelming as one pauses to ponder how numerically insignificant humans are when compared to the insect population Given the biological diversity of the planet it is incumbent upon humans to safeguard the natural beauty of the environment To that end conservation takes on special importance necessitating the balancing of industrial expansion with preserving the flora and fauna surrounding us This book is an important tool in understanding and researching the many different life forms spanning the globe Collected here is a substantial and carefully selected listing of relevant literature on biological diversity and its conservation Following this bibliography are author title and subject indexes to allow for further access to this information The sheer bulk of the works about biological diversity can be so intimidating that a book such as this one becomes useful in sorting through the resources about the importance of life's variety

**Grassland Productivity and Ecosystem Services** Gilles Lemaire, 2011 Grassland ecosystems are deeply affected by human activities and need appropriate management to optimise trade offs between ecosystem functions and services Until now they have mainly been analysed as agro ecosystems for animal production but this book looks beyond the role of grassland as a feeding ground and evaluates other important processes such as carbon sequestration in soils greenhouse gas regulation and biodiversity protection This authoritative volume expertly highlights the need for an immediate balance between agriculture and ecological management for sustainability in the future
