Abstract Convex Analysis:

Abstract Convex Analysis Ivan Singer, 1997-08-14 This book examines abstract convex analysis and presents the results of recent research specifically on parametrizations of Minkowski type dualities and of conjugations of type Lau It explains the main concepts through cases and detailed proofs

Abstract Convexity and Global Optimization Alexander M. Rubinov, 2013-03-14 Special tools are required for examining and solving optimization problems The main tools in the study of local optimization are classical calculus and its modern generalizations which form nonsmooth analysis The gradient and various kinds of generalized derivatives allow us to accomplish a local approximation of a given function in a neighbourhood of a given point This kind of approximation is very useful in the study of local extrema However local approximation alone cannot help to solve many problems of global optimization so there is a clear need to develop special global tools for solving these problems The simplest and most well known area of global and simultaneously local optimization is convex programming The fundamental tool in the study of convex optimization problems is the subgradient which actually plays both a local and global role First a subgradient of a convex function f at a point x carries out a local approximation of f in a neighbourhood of x Second the subgradient permits the construction of an affine function which does not exceed f over the entire space and coincides with f at x This affine function h is called a support function Since $f(y) \geq h(y)$ for all y the second role is global In contrast to a local approximation the function h will be called a global affine support

Duality for Nonconvex Approximation and Optimization Ivan Singer, 2007-03-12 The theory of convex optimization has been constantly developing over the past 30 years Most recently many researchers have been studying more complicated classes of problems that still can be studied by means of convex analysis so called anticonvex and convex anticonvex optimization problems This manuscript contains an exhaustive presentation of the duality for these classes of problems and some of its generalization in the framework of abstract convexity This manuscript will be of great interest for experts in this and related fields

Convex Optimization Theory Dimitri Bertsekas, 2009-06-01 An insightful concise and rigorous treatment of the basic theory of convex sets and functions in finite dimensions and the analytical geometrical foundations of convex optimization and duality theory Convexity theory is first developed in a simple accessible manner using easily visualized proofs Then the focus shifts to a transparent geometrical line of analysis to develop the fundamental duality between descriptions of convex functions in terms of points and in terms of hyperplanes Finally convexity theory and abstract duality are applied to problems of constrained optimization Fenchel and conic duality and game theory to develop the sharpest possible duality results within a highly visual geometric framework This online version of the book includes an extensive set of theoretical problems with detailed high quality solutions which significantly extend the range and value of the book The book may be used as a text for a theoretical convex optimization course the author has taught several variants of such a course at MIT and elsewhere over the last ten

years It may also be used as a supplementary source for nonlinear programming classes and as a theoretical foundation for classes focused on convex optimization models rather than theory It is an excellent supplement to several of our books Convex Optimization Algorithms Athena Scientific 2015 Nonlinear Programming Athena Scientific 2017 Network Optimization Athena Scientific 1998 Introduction to Linear Optimization Athena Scientific 1997 and Network Flows and Monotropic Optimization Athena Scientific 1998 *Journal of Nonlinear and Convex Analysis*, 2007 **Handbook of Generalized Convexity and Generalized Monotonicity** Nicolas Hadjisavvas, Sándor Komlósi, Siegfried S.

Schaible, 2006-01-16 Studies in generalized convexity and generalized monotonicity have significantly increased during the last two decades Researchers with very diverse backgrounds such as mathematical programming optimization theory convex analysis nonlinear analysis nonsmooth analysis linear algebra probability theory variational inequalities game theory economic theory engineering management science equilibrium analysis for example are attracted to this fast growing field of study Such enormous research activity is partially due to the discovery of a rich elegant and deep theory which provides a basis for interesting existing and potential applications in different disciplines The handbook offers an advanced and broad overview of the current state of the field It contains fourteen chapters written by the leading experts on the respective subject eight on generalized convexity and the remaining six on generalized monotonicity *Lagrange-type Functions in Constrained Non-Convex Optimization* Alexander M. Rubinov, Xiao-qi Yang, 2013-11-27 Lagrange and penalty function methods provide a powerful approach both as a theoretical tool and a computational vehicle for the study of constrained optimization problems However for a nonconvex constrained optimization problem the classical Lagrange primal dual method may fail to find a minimum as a zero duality gap is not always guaranteed A large penalty parameter is in general required for classical quadratic penalty functions in order that minima of penalty problems are a good approximation to those of the original constrained optimization problems It is well known that penalty functions with too large parameters cause an obstacle for numerical implementation Thus the question arises how to generalize classical Lagrange and penalty functions in order to obtain an appropriate scheme for reducing constrained optimization problems to unconstrained ones that will be suitable for sufficiently broad classes of optimization problems from both the theoretical and computational viewpoints Some approaches for such a scheme are studied in this book One of them is as follows an unconstrained problem is constructed where the objective function is a convolution of the objective and constraint functions of the original problem While a linear convolution leads to a classical Lagrange function different kinds of nonlinear convolutions lead to interesting generalizations We shall call functions that appear as a convolution of the objective function and the constraint functions Lagrange type functions **Generalized Convexity and Generalized Monotonicity** Nicolas Hadjisavvas, Juan E.

Martinez-Legaz, Jean-Paul Penot, 2012-12-06 Various generalizations of convex functions have been introduced in areas such as mathematical programming economics management science engineering stochastics and applied sciences for example

Such functions preserve one or more properties of convex functions and give rise to models which are more adaptable to real world situations than convex models Similarly generalizations of monotone maps have been studied recently A growing literature of this interdisciplinary field has appeared and a large number of international meetings are entirely devoted or include clusters on generalized convexity and generalized monotonicity The present book contains a selection of refereed papers presented at the 6th International Symposium on Generalized Convexity Monotonicity and aims to review the latest developments in the field

Convex Analysis Georgii G. Magaril-Il'yaev, Vladimir Mikhaïlovich Tikhomirov, This book is an introduction to convex analysis and some of its applications It starts with basis theory which is explained within the framework of finite dimensional spaces The only prerequisites are basic analysis and simple geometry The second chapter presents some applications of convex analysis including problems of linear programming geometry and approximation Special attention is paid to applications of convex analysis to Kolmogorov type inequalities for derivatives of functions of one variable Chapter 3 collects some results on geometry and convex analysis in infinite dimensional spaces A comprehensive introduction written for beginners illustrates the fundamentals of convex analysis in finite dimensional spaces The book can be used for an advanced undergraduate or graduate level course on convex analysis and its applications It is also suitable for independent study of this extremely important area of mathematics

Convex Analysis for Optimization Jan Brinkhuis, 2020-05-05 This textbook offers graduate students a concise introduction to the classic notions of convex optimization Written in a highly accessible style and including numerous examples and illustrations it presents everything readers need to know about convexity and convex optimization The book introduces a systematic three step method for doing everything which can be summarized as conify work deconify It starts with the concept of convex sets their primal description constructions topological properties and dual description and then moves on to convex functions and the fundamental principles of convex optimization and their use in the complete analysis of convex optimization problems by means of a systematic four step method Lastly it includes chapters on alternative formulations of optimality conditions and on illustrations of their use The author deals with the delicate subjects in a precise yet light minded spirit For experts in the field this book not only offers a unifying view but also opens a door to new discoveries in convexity and optimization perfectly suited for classroom teaching Shuzhong Zhang Professor of Industrial and Systems Engineering University of Minnesota

Condition for Global Minimum Through Abstract Convexity Evgeny

Sharikov,2009-11 Subdifferential calculus and separation theorems play a crucial role for applications of classical convex analysis to global optimization More precisely they allow the formulation of conditions necessary or sufficient for the global minimum of some convex optimization problems The theory of abstract convexity generalizes ideas of convex analysis by using the notion of global supports and the global definition of subdifferential In order to apply this theory to optimization we need to extend subdifferential calculus and separation properties into the area of abstract convexity This is the main objective of the present thesis The work should be useful to professionals in generalized convexity and global optimization
