Drilling Overdeepened Alpine Valleys (ICDP-DOVE): Quantifying the Age, Extent, and Environmental Impact of Alpine Glaciations Flavio Anselmetti, Miloš Bavec, Christian Crouzet, Markus Fiebig, Gerald Gabriel, Frank Preusser, Cesare Ravazzi, [Study group] DOVE scientific team, 2022 Abstract The sedimentary infill of glacially overdeepened valleys i e structures eroded below the fluvial base level is an excellent but yet underexplored archive with regard to the age extent and nature of past glaciations The ICDP project DOVE Drilling Overdeepened Alpine Valleys Phase 1 investigates a series of drill cores from glacially overdeepened troughs at several locations along the northern front of the Alps All sites will be investigated with regard to several aspects of environmental dynamics during the Quaternary with focus on the glaciation vegetation and landscape history Geophysical methods e g seismic surveys for example will explore the geometry of overdeepened structures to better understand the process of overdeepening Sedimentological analyses combined with downhole logging analysis of biological remains and state of the art geochronological methods will enable us to reconstruct the erosion and sedimentation history of the overdeepened troughs This approach is expected to yield significant novel data quantifying the extent and timing of Middle and Late Pleistocene glaciations of the Alps In a first phase two sites were drilled in late 2021 into filled overdeepenings below the paleolobe of the Rhine Glacier and both recovered a trough filling composed of multiphase glacial sequences Fully cored Hole 5068_1_C reached a depth of 165 m and recovered 10 m molasse bedrock at the base This hole will be used together with two flush holes 5068_1_A 5068_1_B for further geophysical cross well experiments Site 5068_2 reached a depth of 255 m and bottomed out near the soft rock bedrock contact These two sites are complemented by three legacy drill sites that previously recovered filled overdeepenings below the more eastern Alpine Isar Loisach Salzach and Traun paleoglacier lobes 5068_3 5068_4 5068_5 All analysis and interpretations of this DOVE Phase 1 will eventually lay the ground for an upcoming Phase 2 that will complete the pan Alpine approach This follow up phase will

investigate overdeepenings formerly occupied by paleoglacier lobes from the western and southern Alpine margins through drilling sites in France Italy and Slovenia Available geological information and infrastructure make the Alps an ideal area to study overdeepened structures however the expected results of this study will not be restricted to the Alps Such features are also known from other formerly glaciated mountain ranges which are less studied than the Alps and more problematic with regards to drilling logistics The results of this study will serve as textbook concepts to understand a full range of geological processes relevant to formerly glaciated areas all over our planet
