## **Continuous System Modeling:**

**Continuous System Modeling** François E. Cellier, Jürgen Greifeneder, 2013-03-14 Modeling and Simulation have become endeavors central to all disciplines of science and engineering. They are used in the analysis of physical systems where they help us gain a better understanding of the functioning of our physical world. They are also important to the design of new engineering systems where they enable us to predict the behavior of a system before it is ever actually built. Modeling and simulation are the only techniques available that allow us to analyze arbitrarily non-linear systems accurately and under varying experimental conditions. Continuous System Modeling introduces the student to an important subclass of these techniques. They deal with the analysis of systems described through a set of ordinary or partial differential equations or through a set of difference equations. This volume introduces concepts of modeling physical systems through a set of differential and/or difference equations. The purpose is twofold: it enhances the scientific understanding of our physical world by codifying/organizing knowledge about this world and it supports engineering design by allowing us to assess the consequences of a particular design alternative before it is actually built. This text has a flavor of the mathematical discipline of dynamical systems and is strongly oriented towards Newtonian physical science. **Continuous System Modeling**

The reasons for this trend can also be investigated using simulation, relate not only to the steadily increasing demand for a much wider range of conditions than can be contemplated for the real system, power of computers and the rapidly falling costs of hardware, but also to the availability because of operating constraints or safety of appropriate software tools in the form of requirements. Similar factors can apply in simulation languages. Problem-oriented languages in other fields such as biomedical systems. Languages of this kind assist those who are not engineering specialists in computational methods to transfer system simulation using digital computers can relate either to models based on continuous mathematical descriptions into a simulation program in a simple and straightforward manner, or to discrete event descriptions. They can also provide useful diagnostic information when difficulties are encountered. Therefore a
