The State of Computer-Aided Control System Design (CACSD)

John James, Francois Cellier, Grantham Pang, John Gray, and Sven Erik Mattsson

In this special issue we have tried to provide a sample of the broad range of research activities seeking to provide theoretical foundations and software engineering tools to help control engineers understand and overcome challenges in building computer-controlled devices.

Papers include application of commercially-available software engineering environments to compare alternative PID anti-windup strategies (Bolin and Atherton), to use parallelization to investigate multiobjective optimizations (Chipperfield and Fleming), and to improve control of a commercial polymerization reactor (Oguzsakir). Object-oriented research topics range from creating a fourth-generation language for guidance, navigation, and control problems (Engelhart and Jackson) to a focus on symbolic and numerical computations (Polyakov, Ghasemian,

and Blankenship) to support for controlling mechatronic systems (Katz and Richert) to support for controlling more general systems (Gröbel).

Finally, hybrid systems is an emerging subject area that provides a new look at a recurring issue in control science: the appropriate division of control activities between analog and digital portions of the controlled system. Hybrid systems are those systems that exhibit both continuous and discrete states. Hybrid systems papers include discussion of a separation principle for hybrid control system design (Benscne and Franklin) and discussion of initial thoughts on creation of a software engineering environment for hybrid systems (Kobus et al.).

As computer-controlled systems become ever larger and more complex, the difficulties of achieving performance objectives in the presence of disturbances and modeling uncertainties become ever more challenging. The multidisciplinary nature of modeling and simulation to achieve product and process understanding in diverse application areas such as discrete manufacturing, tele-

Computer Aided Control System Design Mieczysław A. Brdy, Krzysztof Malinowski, 1994 This book is about Computer Aided Control System Design CACSD of the direct process controller Various methods and tools representing an up to date level of development are presented by leading experts Several articles describe main principles and problems associated with modern direct control and with CACSD Existing tools are presented including packages for stability analysis of nonlinear systems adaptive control design and integrated analysis and simulation and tuning of controllers The reader can observe that it is possible to develop CACSD tools by using open general packages such as Matlab or Simulab or by providing specialised software He can then compare both approaches and get an improved understanding of their respective advantages and disadvantages The leading article by the editors presents CACSD Methods and tools in a broader context There is also detailed material on upper control layers hierarchical control and real time systems
