Age of Information Aware Communication Systems Antzela Kosta,2020-04-16 Advances in wireless communications and networking technology have taken us towards a pervasively connected world in which a vast array of wireless devices from mobile phones to environmental sensors seamlessly communicate with each other In many of these systems the freshness of the transmitted information is of high importance Characterization of time critical information can be achieved through the so called real time status updates that are messages encapsulated in packets carrying the timestamp of their generation Status updates track time varying content that needs to be transmitted from the

generation point to a remote destination in a network To quantify the freshness of information in networked systems a novel metric different from delay or latency termed as age of information AoI has been introduced In this thesis we focus on characterizing and controlling age under various communication system setups The first part of the thesis considers multiple access communication systems and comprises two papers The first paper investigates AoI in relation with throughput in a shared access setup with heterogeneous traffic More specifically we consider a shared access system consisting of a primary link and a network of secondary nodes with multipacket reception MPR capabilities To study the joint throughput timeliness performance we formulate two optimization problems considering both objectives and provide guidelines for the design of such a multiple access system satisfying both timeliness and throughput requirements In the second paper we study the AoI performance in various multiple access schemes including scheduling and random access We present an analysis of the AoI with and without packet management at the transmission queue of the source nodes considering that packet management is the capability to replace unserved packets in the queue whenever newer ones arrive We incorporate the effect of channel fading and network path diversity in such a system and provide simulation results that illustrate the impact of network operating parameters on the performance of the considered access protocols The second part of the thesis considers the characterization of AoI and other freshness performance metrics in a point to point communication link again comprising two papers In the third paper of this thesis we expand the concept of information ageing by introducing the cost of update delay CoUD metric to characterize the cost of having stale information at the destination Furthermore we introduce the value of information of update VoIU metric that captures the degree of importance of the update received at the destination We employ queue theoretic concepts and provide a theoretical analysis and insights into the prospects of cost and value Finally in the last paper we study the properties of a sample path of the AoI process and we obtain a general formula of its stationary distribution We relate this result to a discrete time queueing system and provide a general expression of the generating function of AoI in relation with the system time and the peak age of information PAoI To illustrate the applicability of the results we analyze the AoI in single server queues with different disciplines and assumptions We build upon these results to provide a methodology for analyzing general non linear age functions for this type of systems Computer Performance Evaluation, 1995

Computer Performance Evaluation Ramon Puigjaner, Nunzio N. Savino, Bartomeu Serra, 2003-06-26 The need to evaluate computer and communication systems performance and dependability is continuously growing as a consequence of both the increasing complexity of systems and the user requirements in terms of timing behaviour The 10th International Conference on Modelling Techniques and Tools for Computer Performance Evaluation held in Palma in September 1998 was organised with the aim of creating a forum in which both theoreticians and practitioners could interchange recent techniques tools and experiences in these areas This meeting follows the predecessor conferences of this series 1984 Paris 1988 Palma 1994 Wien 1985 Sophia Antipolis 1991 Torino 1995 Heidelberg 1987 Paris 1992 Edinburgh 1997 Saint Malo The

tradition of this conference series continued this year where many high quality papers were submitted The Programme Committee had a difficult task in selecting the best papers Many new papers could not be included in the program due to space constraints All accepted papers are included in this volume Also a set of submissions describing performance modelling tools was transformed into tool presentations and demonstrations A brief description of these tools is included in this volume The following table gives the overall statistics for the submissions

Measurement, Modelling and Evaluation of Dependable Computer and Communication Systems Anne Remke, Boudewijn R. Haverkort, 2016-03-24

This book constitutes the proceedings of the 18th International GI ITG Conference on Measurement Modelling and Evaluation of Computing Systems and Dependability and Fault Tolerance MMB DFT 2016 held in Münster Germany in April 2016 The 12 full papers and 3 short papers included in this volume were carefully reviewed and selected from 23 submissions The papers deal with the fields of performance evaluation dependability and fault tolerance of computer and communication systems A relatively new topic of smart grids is also covered
