#### Ultra-Low Energy Domain-Specific Instruction-Set Processors Francky Catthoor, Praveen Raghavan, Andy

Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility However achieving this goal is already complex when looking at the processor in isolation but in reality the processor is a single component in a more complex system In order to design such complex system successfully critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi dimensional exploration space In the complex global design of battery operated embedded systems the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy aware architecture exploration of domain specific instruction set processors and the co optimization of the datapath architecture foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design By performing an extensive energy breakdown experiment for a complete embedded platform both energy and performance

bottlenecks have been identified together with the important relations between the different components Based on this knowledge architecture extensions are proposed for all the bottlenecks Rapid Prototyping of Digital Systems James O. Hamblen, Michael D. Furman, 2007-05-08 Rapid Prototyping of Digital Systems provides an exciting and challenging laboratory component for undergraduate digital logic and computer design courses The more advanced topics and exercises also make this text useful for upper level courses in digital logic or programmable logic Design engineers working in industry will want to consider this text for a rapid introduction to PPLD technology and logic synthesis using commercial CAD tools Rapid Prototyping of Digital Systems includes two tutorials on the Altera CAD tool environment an overview of programmable logic and a design library with several easy to use input and output functions These features were developed to help students get started quickly Early design examples use schematic capture and library components VHDL is used for more complex designs after a short introduction to VHDL based synthesis The approach used in this text reflects contemporary practice in industry more accurately than the more traditional TTL protoboard based laboratory courses Designs containing up to twenty thousand gates are possible with the Altera Student Version CAD tools and the UP 1 board Rapid Prototyping of Digital Systems contains a number of interesting and challenging laboratory projects involving serial communications state machines with video output video games and graphics simple computers keyboard and mouse interfaces robotics and a RISC processor core These projects were all developed on the student version of the Altera CAD tools and can be implemented on the Altera UP 1 board **Tools and Environments for Parallel and Distributed Computing** Salim Hariri, Manish Parashar, 2004-01-28 Publisher Description
