ADHD as a Model of Brain-Behavior Relationships Leonard F. Koziol, Deborah Ely Budding, Dana Chidekel, 2013-09-24  
ADHD as a Model of Brain Behavior Relationships Leonard F Koziol Deborah Ely Budding and Dana Chidekel Series Title Springer Briefs in Neuroscience Subseries The Vertically Organized Brain in Theory and Practice It s been a basic neurological given the brain does our thinking and has evolved to do the thinking as controlled by the neocortex In this schema all dysfunction can be traced to problems in the brain s lateral interactions But in scientific reality is this really true Challenging this traditional cortico centric view is a body of research emphasizing the role of the structures that control movement the brain s vertical organization in behavioral symptoms Using a well known widely studied disorder as a test case ADHD as a Model of Brain Behavior Relationships offers an innovative framework for integrating neuroscience and behavioral research to refine diagnostic process and advance the understanding of disorders Identifying a profound disconnect between current neuropsychological testing and the way the brain actually functions this revision of the paradigm critiques the DSM and ICD in terms of the connectedness of brain structures regarding cognition and behavior The authors argue for a large scale brain network approach to pathology instead of the localizing that is so common historically and for an alternate set of diagnostic criteria proposed by the NIMH Included in the coverage The diagnosis of ADHD history and context ADHD and neuropsychological nomenclature Research Domain Criteria a dimensional approach to evaluating disorder The development of motor skills executive function and a relation to ADHD The role of the cerebellum in cognition emotion motivation and dysfunction How large scale brain networks interact Heralding a more accurate future of assessment diagnosis and treatment of neurodevelopmental disorders ADHD as a Model of Brain Behavior Relationships represents a major step forward for neuropsychologists child psychologists and psychiatrists or any related profession interested in a neuroscientific understanding of brain function

A comprehensive interdisciplinary review of the research on etiology and treatment of this chronic condition for which there is no known apparent cure With an estimated prevalence rate of 13 per cent SIB occurs most frequently among persons who are retarded and autistic In this volume the field's leading researchers examine a new generation of models and theories with a level of specificity far beyond what was heretofore imagined possible From the burgeoning area of research on functional assessment and the behavioural and biological antecedents of SIB to the role of Lesch Nyhan Syndrome and opioid peptides the work of these foremost basic applied and behavioural researchers is sure to greatly enhance fellow researchers teachers and clinicians understanding of this devastating condition

Data-driven Approaches to Improved Understanding of Brain-behaviour Relationships Daniel Kristanto, 2021

The question of how the brain works has been the core interest of neuroscientists To address this question studies have been done to investigate the brain mechanism to receive process and transmit information One of the approaches is to develop neuronal models to directly capture the microscopic activities and dynamics of the brain Another approach emerges by explaining the brain organization to control human cognitive abilities as the mental expression of human behaviors which differ across individuals This research direction has attracted scientists from different fields and is commonly known as brain behavior relationships In its development this topic receives support from the advanced technology of brain imaging and behavioral tests resulting in the availability of big and freely accessible data Coupled with the development of mathematical techniques recent perspective of brain behavior study has shifted into data driven approach which emphasizes on data exploration rather than initial hypothesis validation Thus some questions arise i to ask whether data driven approach in brain behavior study aside from providing new information is also able to consistently capture the previously established knowledge at the level of single and multiple behaviors towards its complexity to inquire whether data driven approach based on nonlinear model performs better than linear model in prediction and feature extraction and i to develop a general framework of fully nonlinear data driven approach to improved the understanding of brain behavior relationships This thesis answers the first inquiry in Chapter 3 and Chapter 4 for single and multiple behaviors respectively In single behavior a study on reading ability is performed by predicting the reading performance using brain structural and functional properties coming from brain area and connections measures Aside from the prediction performances of reading ability the study also interprets the features extracted from i linear data driven method Interestingly the features presented as reading related brain areas confirm the reading areas established in the literature and provide more understanding on the involvement of motor cortex in reading

ability Chapter 4 focuses on the comparison between cognitive abilities structure explored from the brain properties with the one established from hypothesis of performance covariance in multiple behaviors Similarly this study also shows the consistency of the data driven approaches compared to hypothesis driven approaches and reveals some interpretable dissimilarities in terms of cognitive ability structure Research in Chapter 5 and Chapter 6 are carried out to address inquiries 2 and 3 focusing on the methods in data driven approach Chapter 5 systematically compares linear and nonlinear models to study the brain and behavior relationships Engaging linear correlation and regression for the linear model and artificial neural network for nonlinear model this study shows that the mapping between brain and behavior is better captured by nonlinear relationships Further the analyses on the features of both models reveal that the consistently captured features by both models are interpretable and relevant with the previous studies In addition the nonlinear model is also able to capture more interpretable features not identified in the linear model Motivated by this finding Chapter 6 proposes a framework to implement fully nonlinear data driven approach towards improved understanding of brain behavior relationships This study recruits Graph Neural Networks t distributed Stochastic Neighbor Embedding and kMeans Clustering to find brain clusters based on its structural properties The proposed framework shows promising results First the structural clusters are partially consistent with the Resting State Networks identified from functional brain properties Second the structural properties of the brain belonging to each cluster similarly performs well to predict the performance of behavioral measures Lastly the wide variety of the iv behavioral measures which can be predicted by the clusters suggests that the clusters may reflect how the cognitive functions are organized in the brain Altogether this thesis shows the advantages of using data driven approach to study brain behavior relationships in single and multiple behavior levels It also suggests that exploration using nonlinear approaches may provide better mapping and more interpretable features in brain and behavior studies
