## Analysis & Design of Prestressed Concrete Structures

Plain concrete, commonly known as concrete, is an ultimate mixture of binding material, fine aggregate, coarse aggregate and water. This can be easily moulded to desired shape and size before it loses plasticity and hardness. Plain concrete is strong in compression but very weak in tension. Strength of concrete in tension is very low and hence it is ignored in reinforced concrete (R.C.C.) design. Concrete is termed as reinforced concrete in steel and helping to keep steel at desired distance. This is R.C.C. but all concrete is not equally strong. Prestressed concrete is one of the method of utilizing water cement.

The principle of prestressed concrete is to introduce a compressive stresses in the concrete structure before it is required as the concrete structure. When load is applied, the load stresses developed due to loading has to first satisfy these compressive stresses before introducing tensile stress in concrete.

Thus in prestressed concrete plain concrete is utilized to cover the load. Another important advantage of pre-stressed concrete (PSC) is that cracks are avoided as the ultimate and hence durability is high. The tensile strength of PSC is also high. The deflections of PSC beam is also small and this is due to the larger spans also. PSC is commonly used in the construction of bridges, large columns like dams and shafts, PSC slabs and slotted piles are commonly used.

The material used in PSC is high strength steel and high strength steel. The tensioning of wires may take place in ground or post-tensioning. Post-tensioning consists of casting the concrete before concreting and then tensioning the wires in case of pre-tensioning, the ducts are cast in concrete structure. The concrete of hardness, post-tensioning wires are passed through ducts. After tensioning wires, they are embedded in concrete structure by special method.
