Comparative Hearing:

Comparative Hearing: Mammals Richard R. Fay, 2012-12-06 The Springer Handbook of Auditory Research presents a series of comprehensive and synthetic reviews of the fundamental topics in modern auditory research. The volumes are aimed at all individuals with interests in hearing research including advanced graduate students, postdoctoral researchers, and clinical investigators. The volumes are intended to introduce new investigators to important aspects of hearing science and to help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely. Each volume is intended to present a particular topic comprehensively and each chapter will serve as a synthetic overview and guide to the literature. As such, the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer-reviewed journals. The volumes focus on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop. New research areas will be covered on a timely basis in the series as they begin to mature. Each volume in the series consists of five to eight substantial chapters on a particular topic. In some cases, the topics will be ones of traditional interest for which there is a substantial body of data and theory such as auditory neuroanatomy Vol 1 and neurophysiology Vol 2. Other volumes in the series will deal with topics which have begun to mature more recently such as development, plasticity, and computational models of neural processing.

Insights from Comparative Hearing Research Christine Köppl, Geoffrey A.

Manley, Arthur N. Popper, Richard R. Fay, 2014-07-08 The hearing organs of non-mammals which show quite large and systematic differences to each other and to those of mammals provide an invaluable basis for comparisons of structure and function. By taking advantage of the vast diversity of possible study organisms provided by the library that is biological diversity, it is possible to learn how complex functions are realized in the inner ear through the evolution of specific structural, cellular, and molecular configurations. Insights from Comparative Hearing Research brings together some of the most exciting comparative research on hearing and shows how this work has profoundly impacted our understanding of hearing in all vertebrates.

Comparative Hearing: Fish and Amphibians Richard R. Fay, 2012-12-06 A major goal of hearing research is to explain how the human auditory system normally functions and to help identify the causes of and treatments for hearing impairment. Experimental approaches to this research make use of animal models that are developed, evaluated, and validated to determine what can be generalized from one species to another. By investigating the structures, physiological functions, and hearing capabilities of various species, comparative hearing research establishes the biological and evolutionary context for such models. This volume brings together our current understanding of the auditory systems of two of the major vertebrate classes, fish and amphibians. It overcomes the differing theoretical and experimental paradigms that underlie most work on these groups and treats both fish and amphibians together in most chapters in order to address broader comparative issues.

Comparative Hearing: Birds and Reptiles Robert J. Dooling, Richard R. Fay, 2012-12-06 Birds and reptiles have long

fascinated investigators studying hearing and the auditory system The highly evolved auditory inner ear of birds and reptiles shares many characteristics with the ear of mammals Thus the two groups are essential in understanding the form and function of the vertebrate and mammalian auditory systems Comparative Hearing Birds and Reptiles covers the broad range of our knowledge of hearing and acoustic communication in both groups of vertebrates This volume addresses the many similarities in their auditory systems as well as the known significant differences about hearing in the two groups

Comparative Hearing: Insects Ronald R. Hoy, Richard R. Fay, 2012-12-06 The Springer Handbook of Auditory Research presents a series of comprehensive and synthetic reviews of the fundamental topics in modern auditory research The volumes are aimed at all individuals with interests in hearing research including advanced graduate students postdoctoral researchers and clinical investigators The volumes are intended to introduce new investigators to important aspects of hearing science and to help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely Each volume is intended to present a particular topic comprehensively and each chapter serves as a synthetic overview and guide to the literature As such the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer reviewed journals The volumes focus on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop New research areas will be covered on a timely basis in the series as they begin to mature Comparative Studies of Hearing in Vertebrates A. N. Popper, R. R. Fay, 2012-12-06 The past two decades have seen an extraordinary growth of interest in the auditory mechanisms of a wide range of vertebrates and invertebrates Investigations have ranged from auditory mechanisms in relatively simple animals where just a few cells are employed for detection of sound to the highly complex detection and processing systems of man and the other mammals Of particular significance to us has been the growing interest in general principles of vertebrate auditory system organization as opposed to a specific and limited concern for the mammalian or even human systems Some of the interest in nonmammalian systems has risen from the desire to find simpler experimental models for both the essential components e.g the hair cell receptor and the more complex functions e.g frequency analysis of all vertebrate auditory systems Interest has also risen from questions about the evolution of hearing and the covariation or lack of it in structure and function in a wide variety of biological solutions to the problems of acoustic mechanoreception Of course the desire to find simpler experimental models and the need to answer questions about the evolution of hearing are not unrelated In fact detailed analyses of a variety of systems have led several times to the realization that some of the simple systems are more complex than initially thought Comparative Studies of Hearing in Vertebrates Arthur N.
