Constraint Programming and Decision Making: Theory and Applications Martine Ceberio, Vladik Kreinovich, 2017-09-07

This book describes new algorithms and ideas for making effective decisions under constraints including applications in control engineering manufacturing how to optimally determine the production level econometrics how to better predict stock market behavior and environmental science and geosciences how to combine data of different types It also describes general algorithms and ideas that can be used in other application areas The book presents extended versions of selected papers from the annual International Workshops on Constraint Programming and Decision Making CoProd XX from 2013 to 2016 These workshops held in the US El Paso Texas and in Europe W rzburg Germany and Uppsala Sweden have attracted researchers and practitioners from all over the world It is of interest to practitioners who benefit from the new techniques to researchers who want to extend the ideas from these papers to new application areas and or further improve the corresponding algorithms and to graduate students who want to learn more in short to anyone who wants to make more effective decisions under constraints **Linear Programming for Decision Making** David Ray Anderson, 1981

Constraint Programming and Decision Making Martine Ceberio, Vladik Kreinovich, 2014-01-21 In many application areas

it is necessary to make effective decisions under constraints Several area specific techniques are known for such decision problems however because these techniques are area specific it is not easy to apply each technique to other applications areas Cross fertilization between different application areas is one of the main objectives of the annual International Workshops on Constraint Programming and Decision Making Those workshops held in the US El Paso Texas in Europe Lyon France and in Asia Novosibirsk Russia from 2008 to 2012 have attracted researchers and practitioners from all over the world This volume presents extended versions of selected papers from those workshops These papers deal with all stages of decision making under constraints 1 formulating the problem of multi criteria decision making in precise terms 2 determining when the corresponding decision problem is algorithmically solvable 3 finding the corresponding algorithms and making these algorithms as efficient as possible and 4 taking into account interval probabilistic and fuzzy uncertainty inherent in the corresponding decision making problems The resulting application areas include environmental studies selecting the best location for a meteorological tower biology selecting the most probable evolution history of a species and engineering designing the best control for a magnetic levitation train *Algorithms for Decision Making* Mykel J.

Kochenderfer, Tim A. Wheeler, Kyle H. Wray, 2022-08-16 A broad introduction to algorithms for decision making under uncertainty introducing the underlying mathematical problem formulations and the algorithms for solving them Automated decision making systems or decision support systems used in applications that range from aircraft collision avoidance to breast cancer screening must be designed to account for various sources of uncertainty while carefully balancing multiple objectives This textbook provides a broad introduction to algorithms for decision making under uncertainty covering the

underlying mathematical problem formulations and the algorithms for solving them The book first addresses the problem of reasoning about uncertainty and objectives in simple decisions at a single point in time and then turns to sequential decision problems in stochastic environments where the outcomes of our actions are uncertain It goes on to address model uncertainty when we do not start with a known model and must learn how to act through interaction with the environment state uncertainty in which we do not know the current state of the environment due to imperfect perceptual information and decision contexts involving multiple agents The book focuses primarily on planning and reinforcement learning although some of the techniques presented draw on elements of supervised learning and optimization Algorithms are implemented in the Julia programming language Figures examples and exercises convey the intuition behind the various approaches presented

The problem of selection of alternatives or the problem of decision making in the modern world has become the most important class of problems constantly faced by business people researchers doctors and engineers The fields that are almost entirely focused on conflicts where applied mathematics is successfully used are law military science many branches of economics sociology political science and psychology There are good grounds to believe that medicine and some branches of biology and ethics can also be included in this list Modern applied mathematics can produce solutions to many tens of classes of conflicts differing by the composition and structure of the participants specific features of the set of their objectives or interests and various characteristics of the set of their actions strategies behaviors controls and decisions as applied to various principles of selection or notions of decision optimization The current issues of social and economic systems involve the necessity to coordinate and jointly optimize various lines of development and activities of modern society For this reason the decision problems arising in investigation of such systems are versatile which shows up not only in the multiplicity of participants their interests and complexity of reciprocal effects but also in the laborious development of social utility criteria for a variety of indices and versatile objectives The efficient decision methods for such complex systems can be developed only the basis of specially developed mathematical tools

Forward-Looking Decision Making Robert E. Hall,2010-02-08 Individuals and families make key decisions that impact many aspects of financial stability and determine the future of the economy These decisions involve balancing current sacrifice against future benefits People have to decide how much to invest in health care exercise their diet and insurance They must decide how much debt to take on and how much to save And they make choices about jobs that determine employment and unemployment levels Forward Looking Decision Making is about modeling this individual or family based decision making using an optimizing dynamic programming model Robert Hall first reviews ideas about dynamic programs and introduces new ideas about numerical solutions and the representation of solved models as Markov processes He surveys recent research on the parameters of preferences the intertemporal elasticity of substitution the Frisch elasticity of labor supply and the Frisch cross elasticity He then examines dynamic programming models applied to health spending long term care insurance employment entrepreneurial risk taking and consumer debt Linking theory with data and applying them to real world problems Forward Looking Decision Making uses dynamic optimization programming models to shed light on individual behaviors and their economic implications
