

Water Requirements of Crop Plants

- The rate at which water if available would be removed from the soil and plant surface is potential evapotranspiration (PET).
- The ratio of evapotranspiration (ET) to (PET) gives figure called **relative evapotranspiration** or **crop coefficient** (K_{co}).
- Energy is required to evaporate water from soil and to cause plants to transpire.
- Crops utilize only 1 to 2% of energy received. Utilization of energy may become **the next limiting factor** when moisture is adequate and good cropping practices are followed.
- Many crops have critical stages of growth when a water deficient will cause unusually large reduction in yield.
